LAB 1

TITLE: INTRODUCTION TO PACKET TRACER.

BACKGROUND THERORY:

Cisco Packet tracer is a network simulation tool developed by Cisco. It allows users to create, configure, and test virtual network topologies without needing physical devices. It is widely used by students to learn about networking concepts, routing, switching, VLANs and more. The software provides a drag-and-drop interface for routers, switches, PCs, and cables, making it easy to build and simulate networks. The interface of Cisco packet Tracer is shown below in figure.

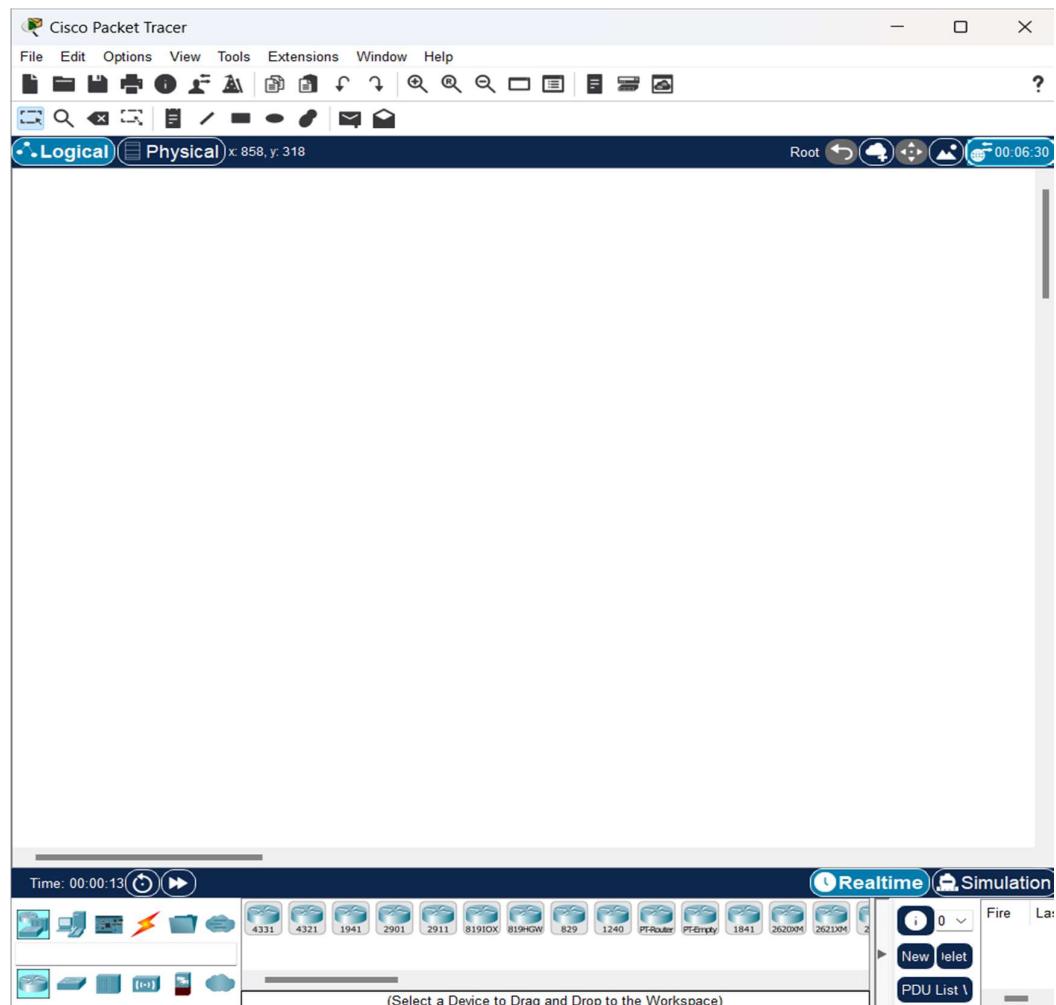

Figure 1: Interface of Cisco Packet Tracer

CONCLUSION:

The aim of this lab is to become familiar with Cisco Packet Tracer. We will learn more about its working environment in the following labs.

LAB 2

TITLE: BUILDING A LOCAL AREA NETWORK USING PACKET TRACER.

BACKGROUND THEORY:

A LAN is a group of computers/devices connected in a small area like an office, school, or home. All devices can share resources (files, printers, Internet) and communicate with each other. LANs use switches to connect multiple devices.

NETWORK DEVICES REQUIRED:

- A switch
- 2 PCs
- 2 laptops
- Straight through wires

PROCESS:

Step 1: Set up the devices.

- Add 1 2960 switch
- Add 2 PCs (PC0,PC1)
- Add 2 laptops (laptop0, laptop1)
- Connect all the devices to switch.

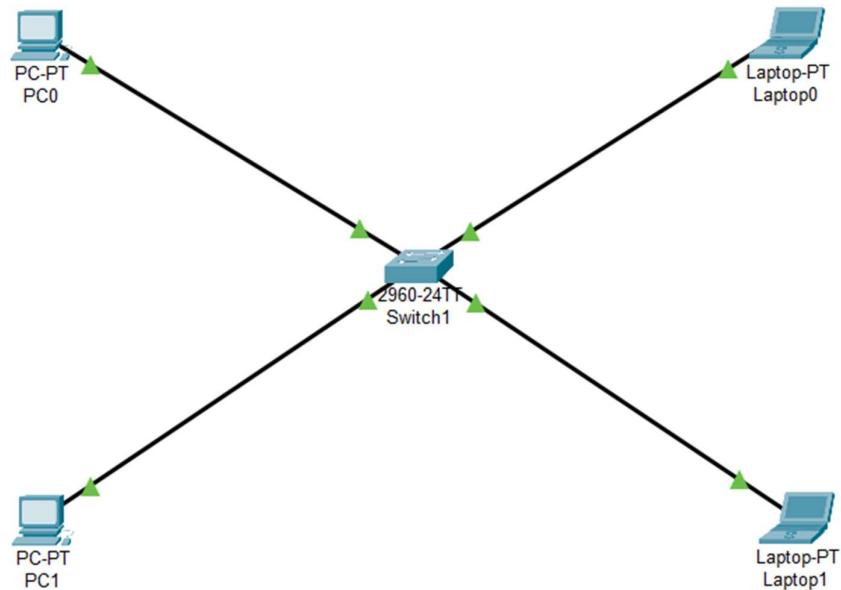

Figure 2: Connection between devices and switch

Step 2: Assign IP addresses to PCs and laptops.

Click each PC → Desktop → IP Configuration

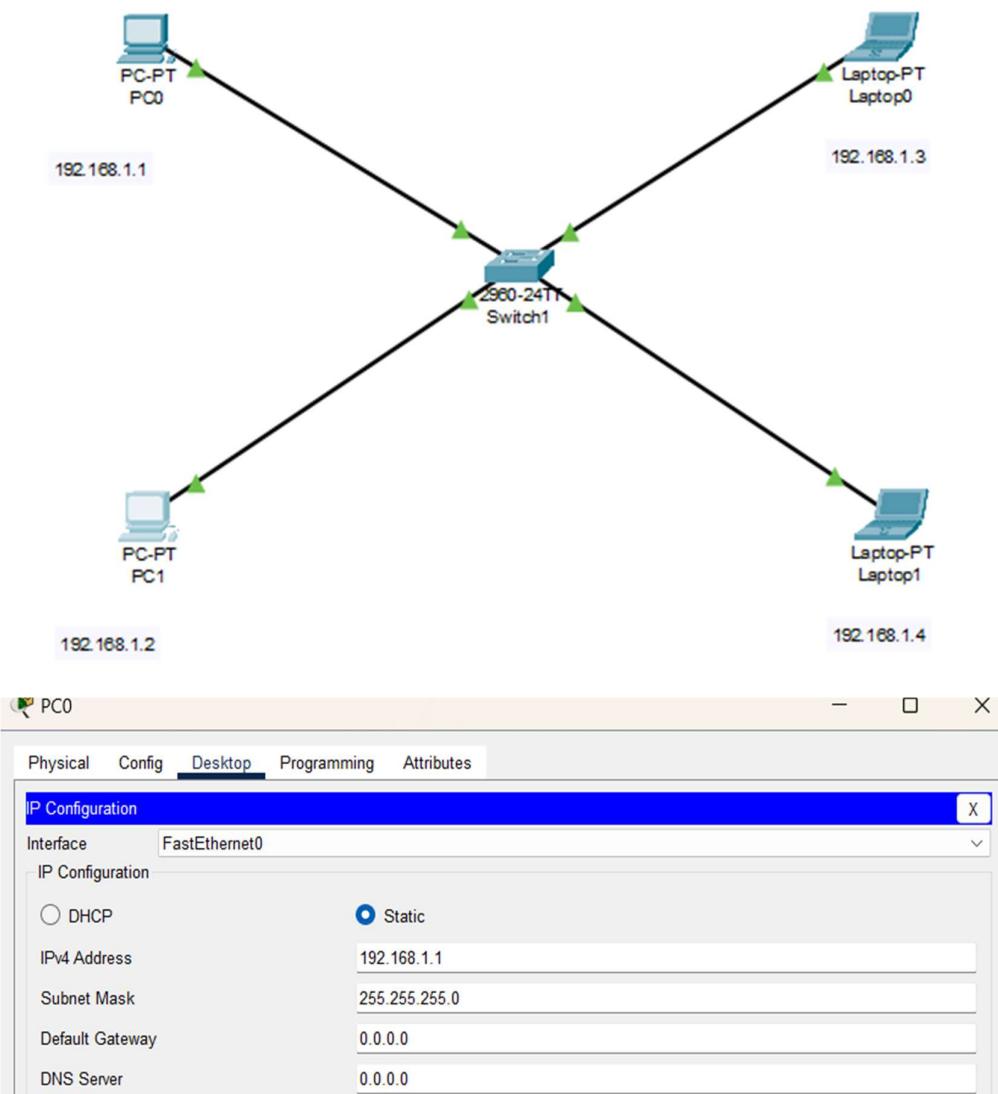

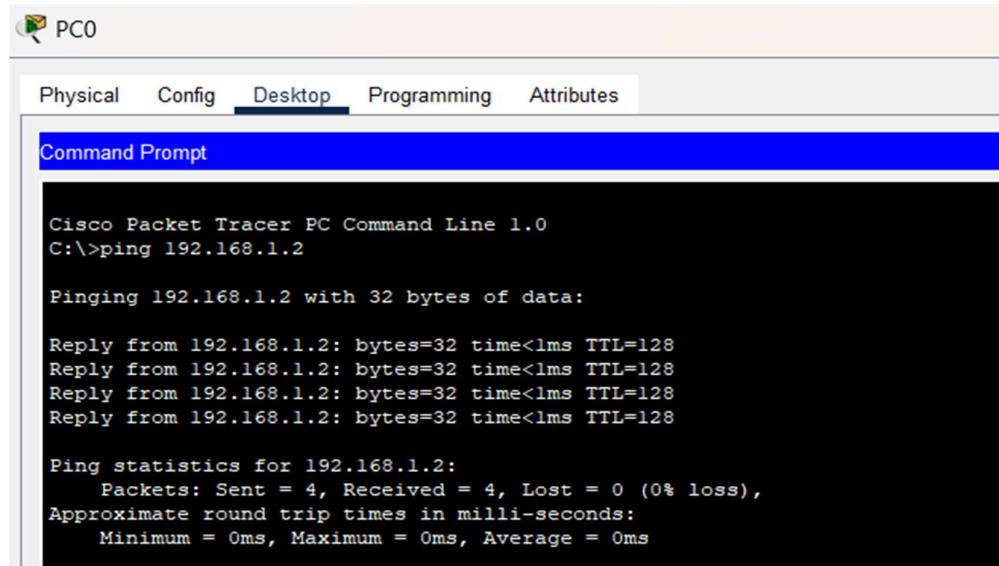

Figure 3: Assigning IP address to PC0

Step 3: Checking the connection between PCs and laptops to make sure they can send/receive packets.

- First from PC0 to PC1. Ping IP address of PC1 on PC0.
- On PC0, go to Desktop -> Command prompt

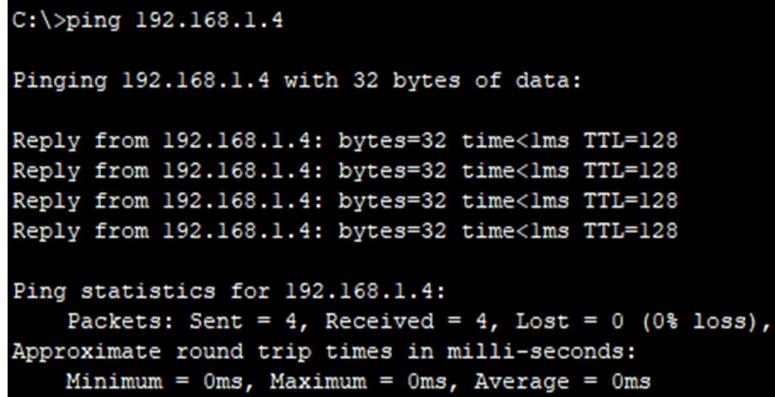

```
Cisco Packet Tracer PC Command Line 1.0
C:\>ping 192.168.1.2

Pinging 192.168.1.2 with 32 bytes of data:

Reply from 192.168.1.2: bytes=32 time<1ms TTL=128

Ping statistics for 192.168.1.2:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
    Approximate round trip times in milli-seconds:
        Minimum = 0ms, Maximum = 0ms, Average = 0ms
```

- Secondly, laptop0 to laptop1.

```
C:\>ping 192.168.1.4

Pinging 192.168.1.4 with 32 bytes of data:

Reply from 192.168.1.4: bytes=32 time<1ms TTL=128

Ping statistics for 192.168.1.4:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
    Approximate round trip times in milli-seconds:
        Minimum = 0ms, Maximum = 0ms, Average = 0ms
```

OBSERVATION:

All the devices are connection to each other and can send/ receive packets.

CONCLUSION:

Simple LAN is created using Cisco Packet Tracer.

LAB 3

TITLE: INTERCONNECTION TWO DIFFERENT LANS AND TESTING THE CONNECTIVITY BETWEEN THEM.

BACKGROUND THEORY:

LAN interconnection or internetworking is the process of interconnection two different LANs using router. In this lab two different LANs are used to test the connectivity between them. LANs are commonly used in home WIFI networks and small business networks.

NETWORK DEVICES REQUIRED:

- Router
- 2 Switches
- 4 PCs
- Straight through wires

PROCESS:

Step 1: Set up all the devices and establish the connection between them using wires.

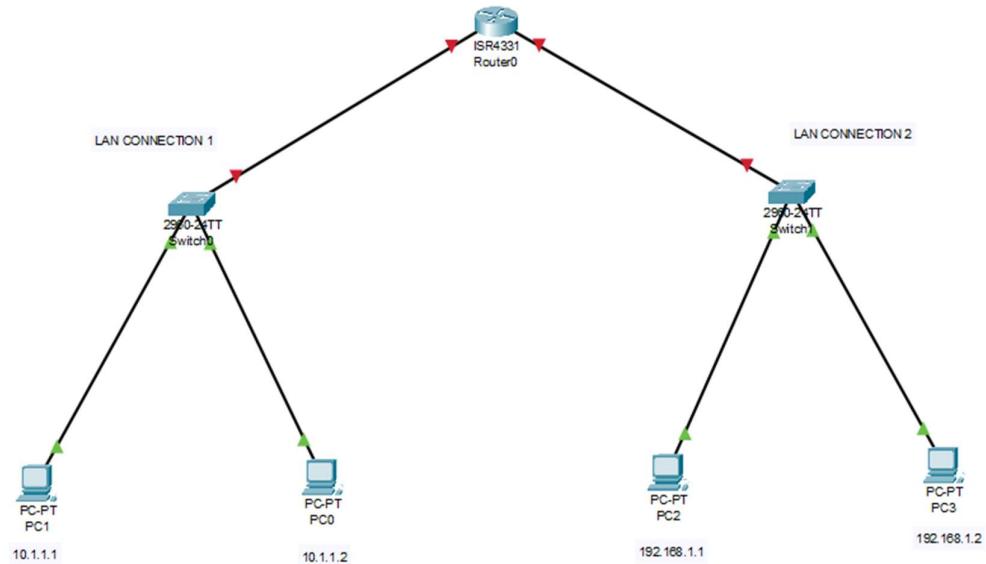

Figure 4: Connecting devices using wires

Step 2: Assign IP addresses to all the PCs.

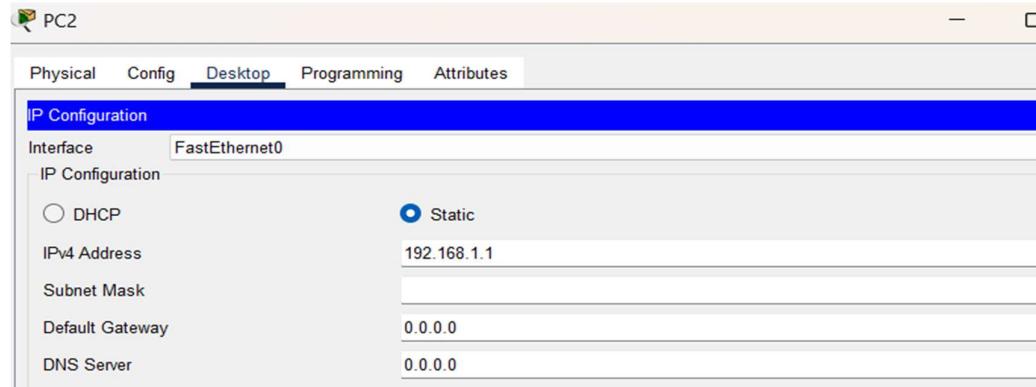

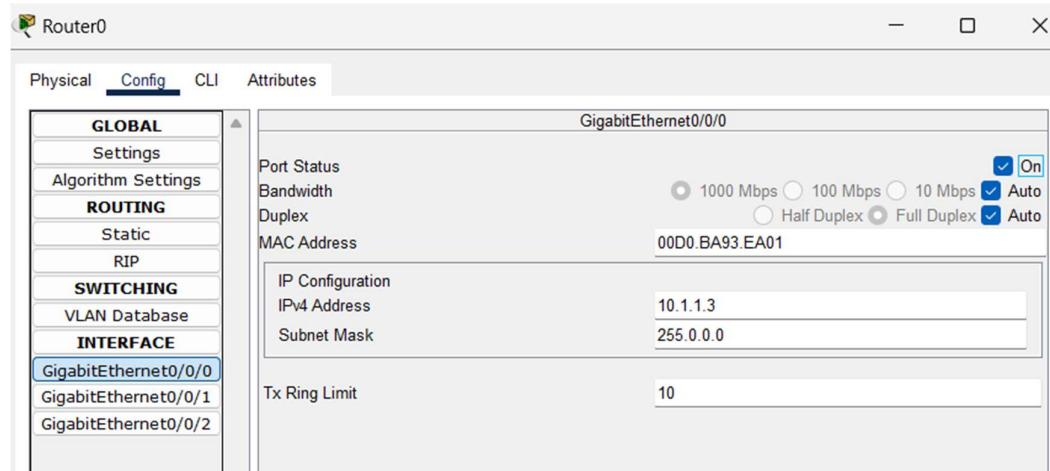

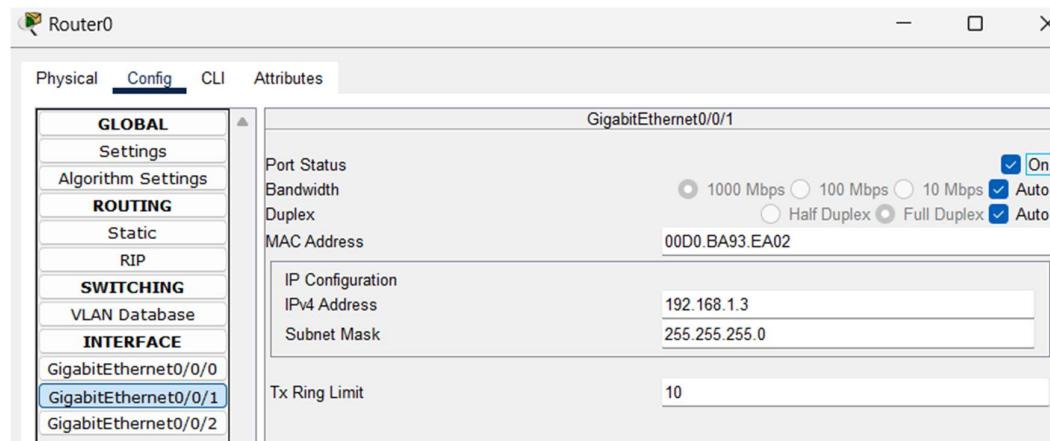

Figure 5: Assigning IP address to PC2

Step 3: Enabling the connection with router.

- Click on router -> Config ->GigabitEthernet0/0/0 and assign the IP address.

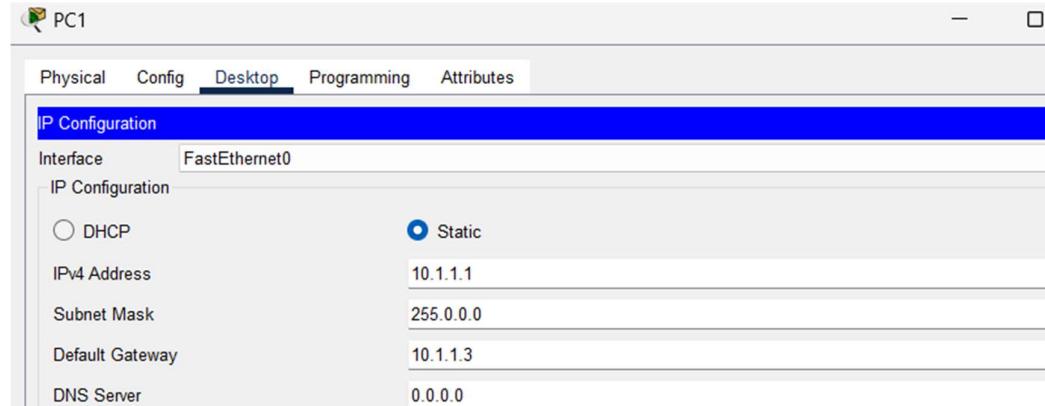

- Click on router -> Config ->GigabitEthernet0/0/1 and assign the IP address.

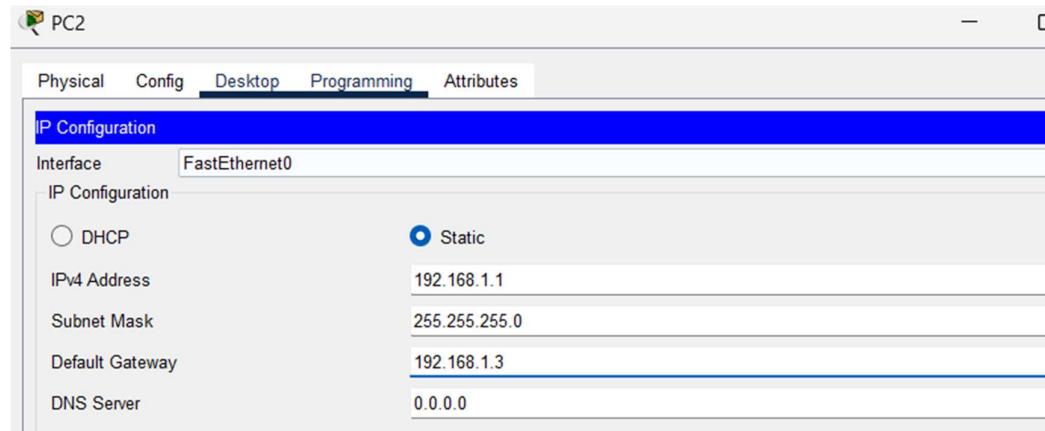

Step 4: Assign Default Gateway to LAN CONNECTION 1 AND 2 PCs.

- For PC1 of LAN1, click on PC1 -> desktop -> IP configuration -> default Gateway.

- Similarly, for PC0 assign the same value.
- Again, for PC2 of LAN2,

Step 5: Check the connectivity for PC0 TO PC4.

PC0

Physical Config Desktop Programming Attributes

Command Prompt

```
Cisco Packet Tracer PC Command Line 1.0
C:>ping 192.168.1.2

Pinging 192.168.1.2 with 32 bytes of data:

Reply from 192.168.1.2: bytes=32 time<1ms TTL=127
Reply from 192.168.1.2: bytes=32 time<1ms TTL=127
Reply from 192.168.1.2: bytes=32 time=<1ms TTL=127
Reply from 192.168.1.2: bytes=32 time=<1ms TTL=127

Ping statistics for 192.168.1.2:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
    Approximate round trip times in milli-seconds:
        Minimum = 0ms, Maximum = 1ms, Average = 0ms
```

CONCLUSION:

The two different LAN CONNECTIONS are interconnected with each other.

LAB 4

TITLE: DHCP, DNS AND WEB SERVER USING PACKET TRACER.

BACKGROUND THEORY:

In a network, DHCP, DNS, Web server work together to provide essential services.

DHCP (Dynamic Host Configuration Protocol) automatically assigns IP addresses to devices, making network setup easier.

DNS (Domain Name System) translates domain name (like www.google.com) into IP addresses so browsers can locate websites.

A Web Server hosts websites and delivers web pages to users over the internet or local network.

NETWORK DEVICES REQUIRED:

- A router
- A switch
- 3 servers
- 3 PCs
- 1 laptop
- Cables

PROCESS:

Step 1: Set up all the devices.

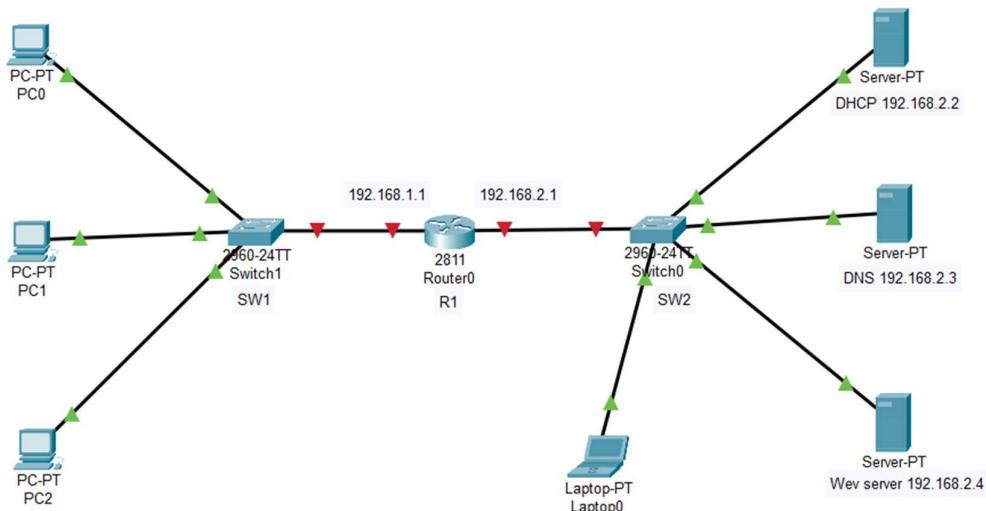

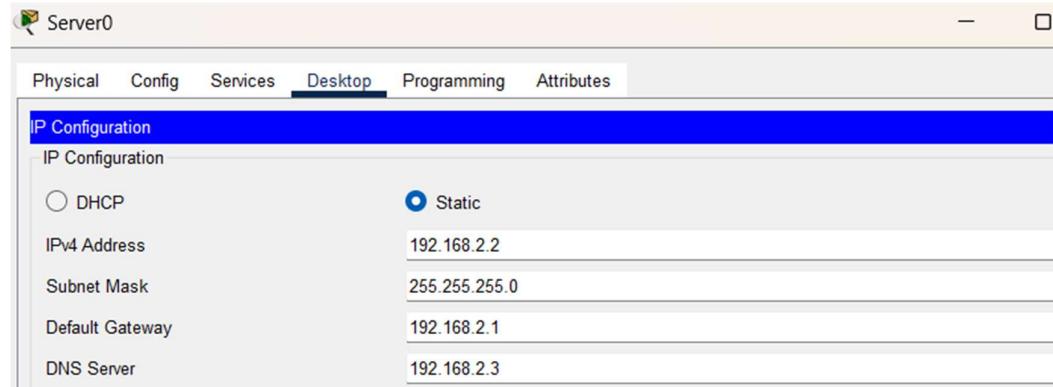

Figure 6: Connecting all the devices using cables

Step 2: Assign IP address to DHCP server.

Click on server→ Desktop →IP Configuration

Step 3: Enable the service for DHCP and create two pools: serverPool0 and serverPool1.

Click on server→ services →DHCP

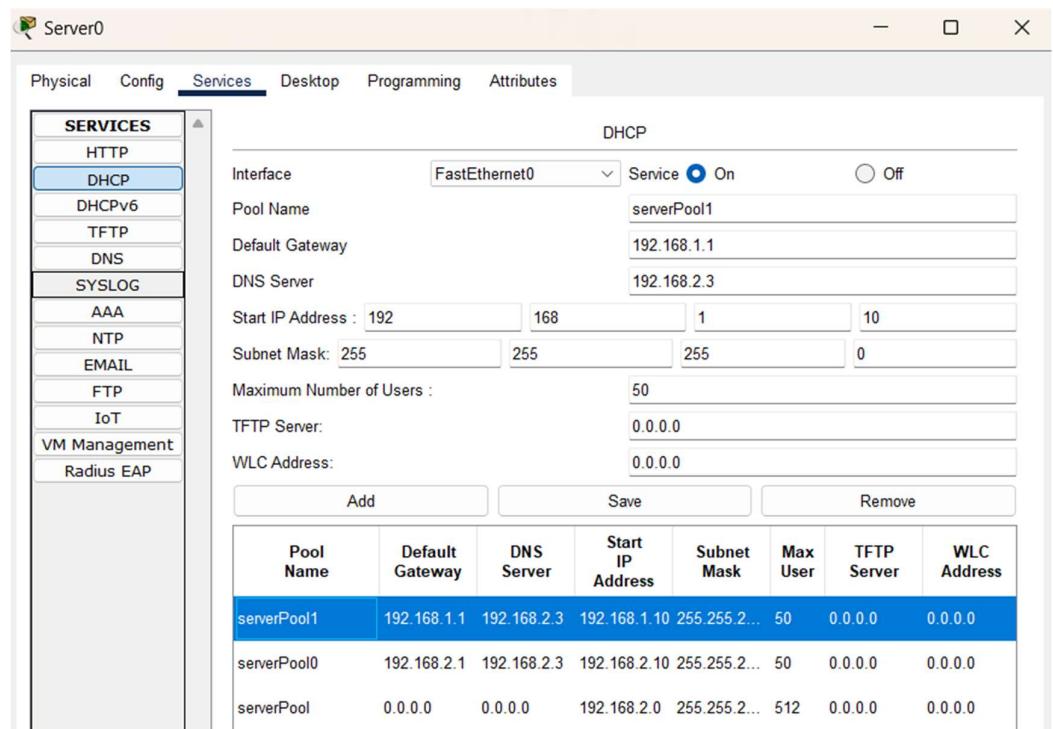

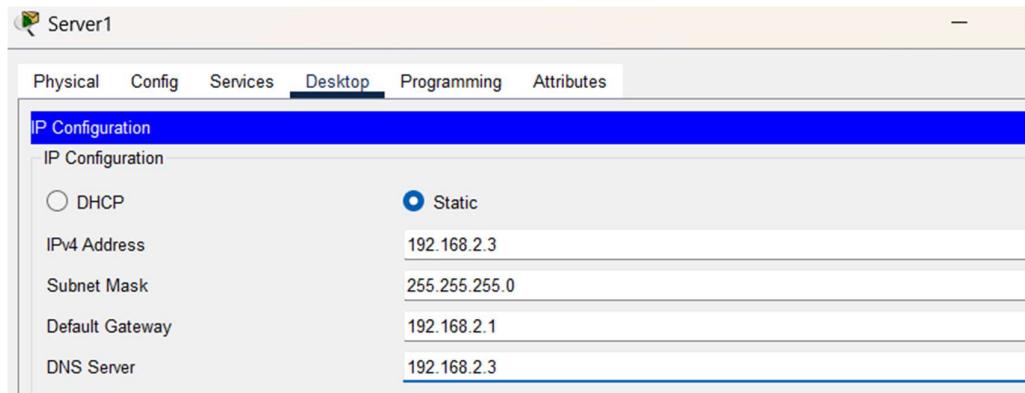

Figure 7: Configuration of DHCP server

Step 4: Assign IP address to DNS server.

Step 5: Give Domain name to your server.

Click on server→ services →DNS

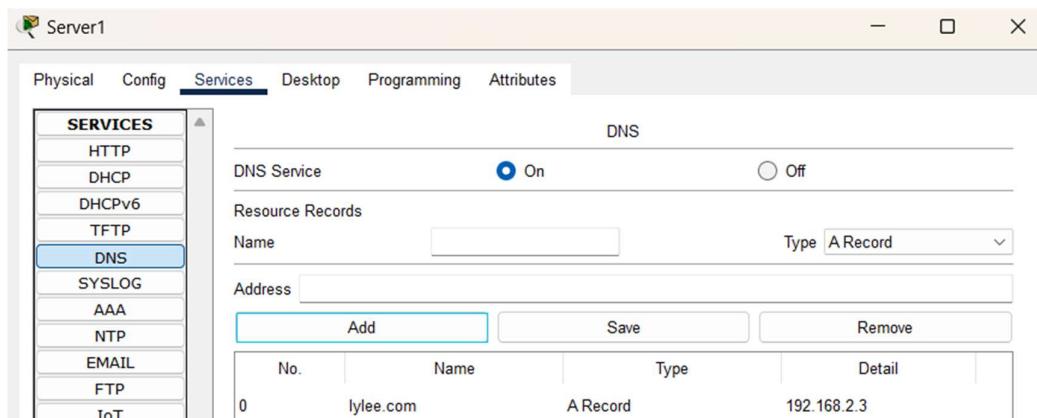

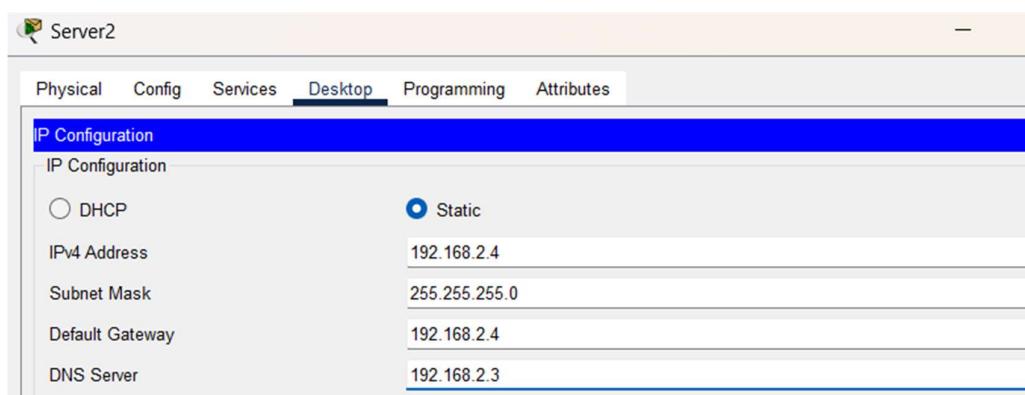

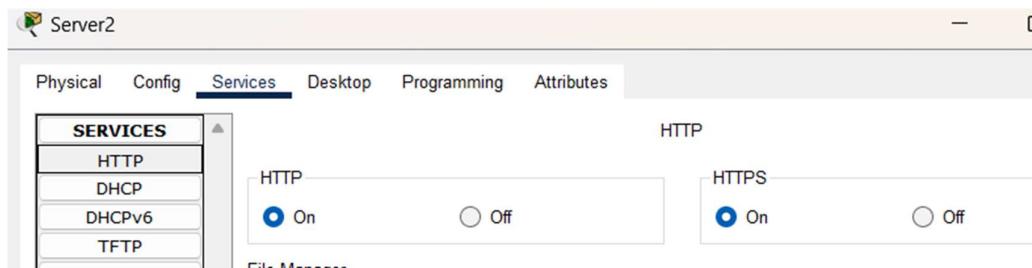

Figure 8: Configure DNS server

Step 6: Assign IP address to Web server.

Step 7: Enable http services.

Step 8: Check DHCP server configuration.

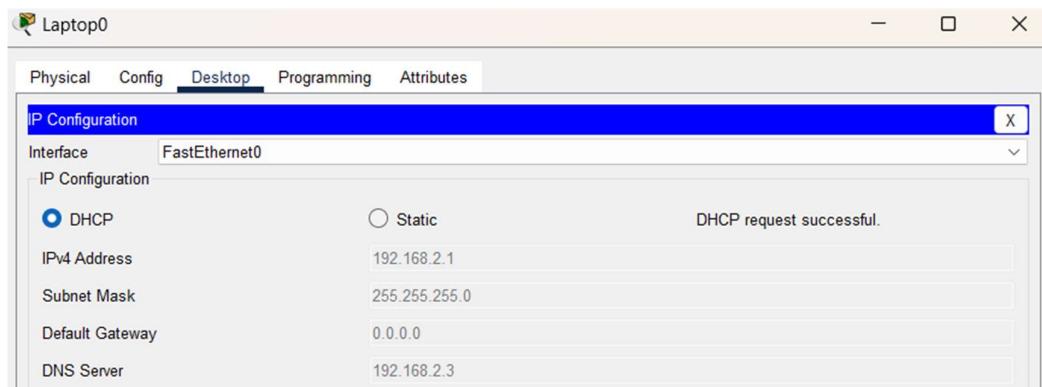

Figure 9: Successful DHCP configuration

Step 9: Check DNS and web server.

Click on server→ Desktop →Web browser

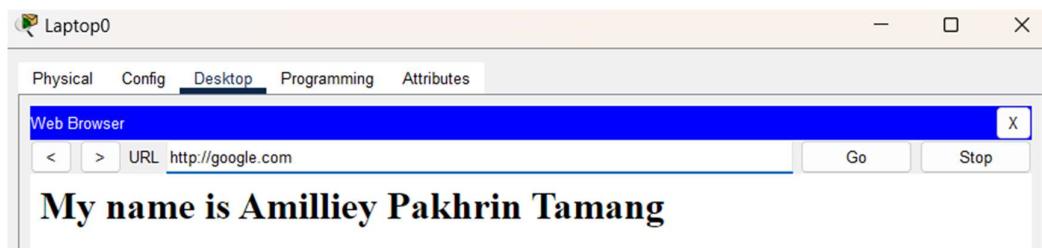

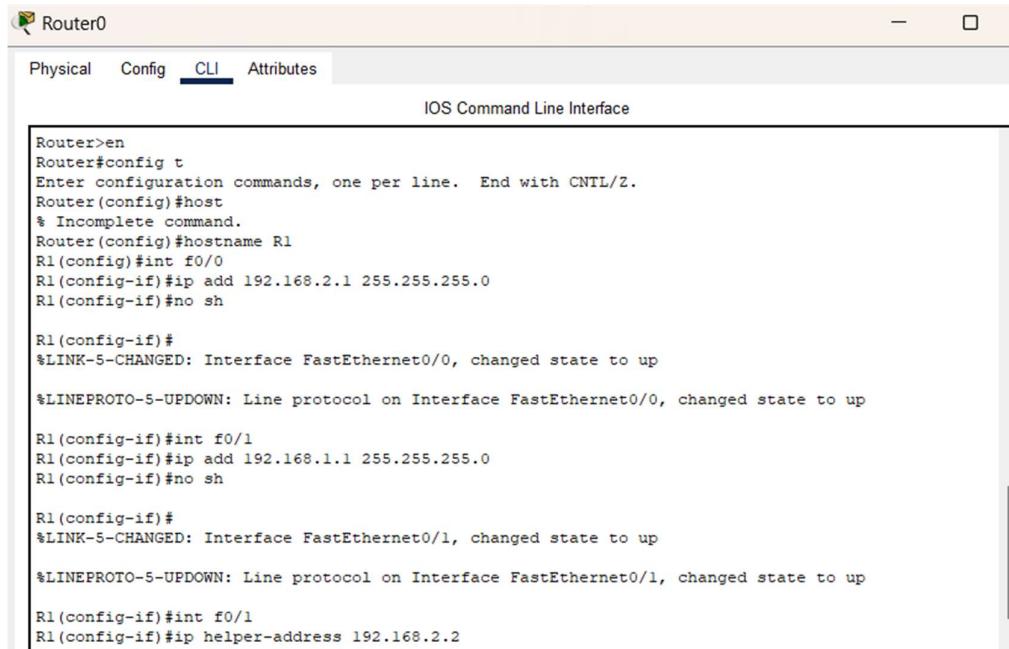

Figure 10: DNS and web browser

Step 10: Configure the router.

Click on router→ CLI

The screenshot shows the Router0 CLI interface. The tab bar at the top has 'Physical', 'Config', 'CLI' (which is selected), and 'Attributes'. Below the tab bar is the title 'IOS Command Line Interface'. The main area contains the following configuration commands:

```
Router>en
Router#config t
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)#host
% Incomplete command.
Router(config)#hostname R1
R1(config)#int f0/0
R1(config-if)#ip add 192.168.2.1 255.255.255.0
R1(config-if)#no sh

R1(config-if)#
%LINK-5-CHANGED: Interface FastEthernet0/0, changed state to up

%LINEPROTO-5-UPDOWN: Line protocol on Interface FastEthernet0/0, changed state to up

R1(config-if)#int f0/1
R1(config-if)#ip add 192.168.1.1 255.255.255.0
R1(config-if)#no sh

R1(config-if)#
%LINK-5-CHANGED: Interface FastEthernet0/1, changed state to up

%LINEPROTO-5-UPDOWN: Line protocol on Interface FastEthernet0/1, changed state to up

R1(config-if)#int f0/1
R1(config-if)#ip helper-address 192.168.2.2
```

Figure 11: Configuration of router

Step 11: Check DHCP connection with PC0

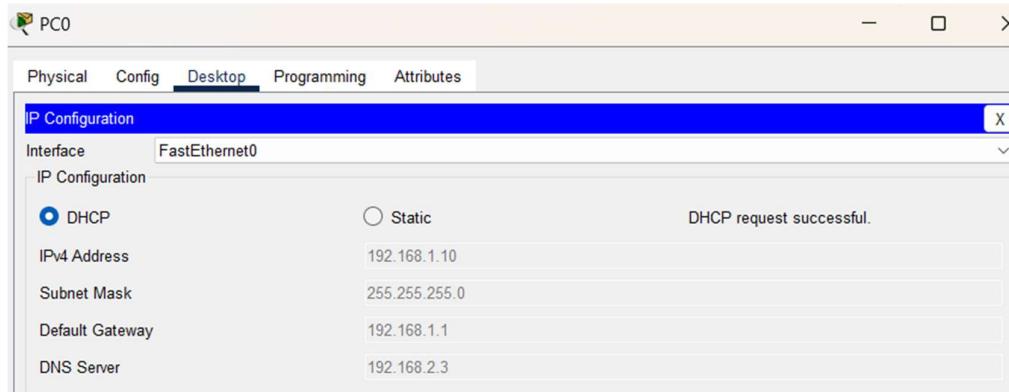

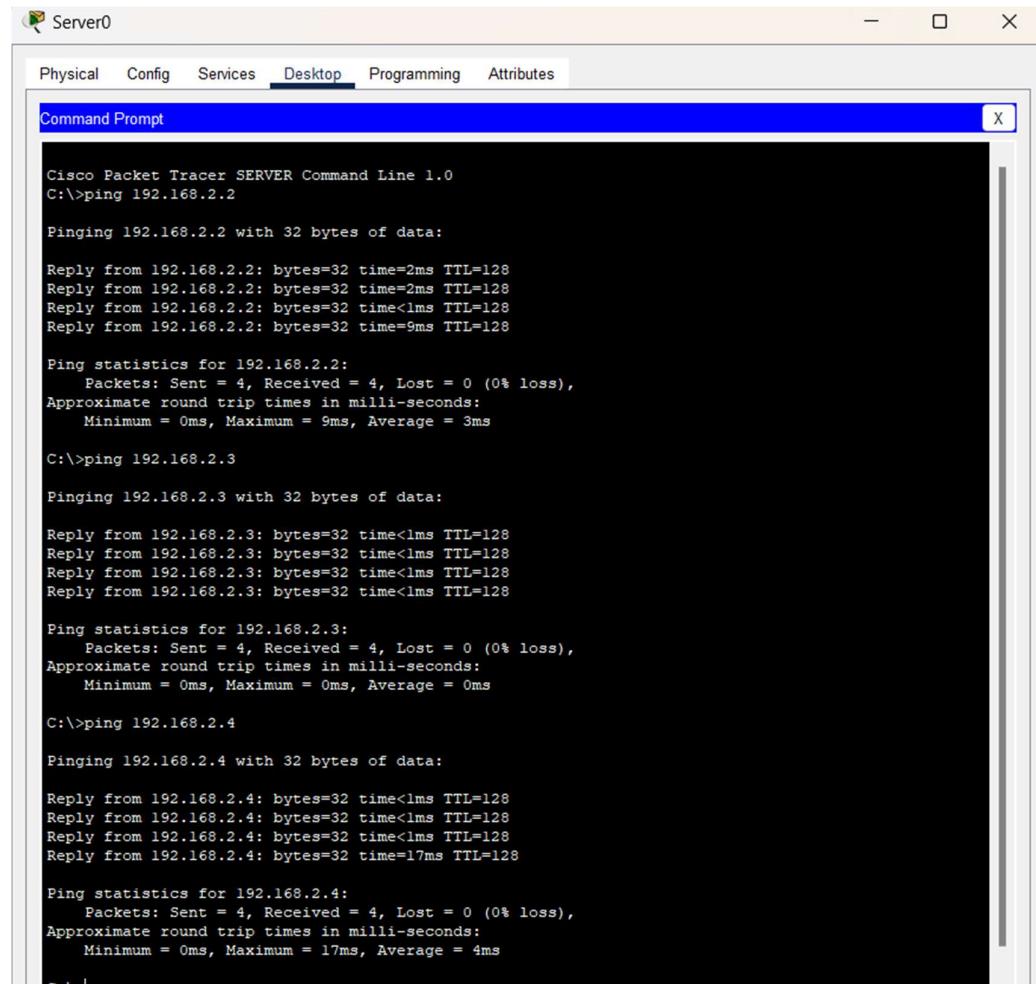

Figure 12: Successful DHCP connection with PC0

OUTPUT:

The screenshot shows a Windows-style window titled "Server0" with a tab bar at the top. The "Desktop" tab is selected. Below it is a "Command Prompt" window with the title "Cisco Packet Tracer SERVER Command Line 1.0". The command line shows several "ping" commands being run against IP addresses 192.168.2.2, 192.168.2.3, and 192.168.2.4. Each ping command displays four replies from the target host, followed by ping statistics showing 0% loss and low round-trip times (e.g., 3ms, 0ms).

```
Cisco Packet Tracer SERVER Command Line 1.0
C:\>ping 192.168.2.2

Pinging 192.168.2.2 with 32 bytes of data:

Reply from 192.168.2.2: bytes=32 time=2ms TTL=128
Reply from 192.168.2.2: bytes=32 time=2ms TTL=128
Reply from 192.168.2.2: bytes=32 time<1ms TTL=128
Reply from 192.168.2.2: bytes=32 time=9ms TTL=128

Ping statistics for 192.168.2.2:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
    Approximate round trip times in milli-seconds:
        Minimum = 0ms, Maximum = 9ms, Average = 3ms

C:\>ping 192.168.2.3

Pinging 192.168.2.3 with 32 bytes of data:

Reply from 192.168.2.3: bytes=32 time<1ms TTL=128

Ping statistics for 192.168.2.3:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
    Approximate round trip times in milli-seconds:
        Minimum = 0ms, Maximum = 0ms, Average = 0ms

C:\>ping 192.168.2.4

Pinging 192.168.2.4 with 32 bytes of data:

Reply from 192.168.2.4: bytes=32 time<1ms TTL=128
Reply from 192.168.2.4: bytes=32 time<1ms TTL=128
Reply from 192.168.2.4: bytes=32 time<1ms TTL=128
Reply from 192.168.2.4: bytes=32 time=17ms TTL=128

Ping statistics for 192.168.2.4:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
    Approximate round trip times in milli-seconds:
        Minimum = 0ms, Maximum = 17ms, Average = 4ms
```

CONCLUSION:

DHCP, DNS and web server is successfully configured using packet tracer.

LAB 5

TITLE: IMPLEMENTATION OF VLAN USING PACKET TRACER

BACKGROUND THEORY:

VLAN (Virtual LAN) divides a physical LAN into multiple logical networks. Devices in the same VLAN can communicate even if they are on different switches. VLAN improves network security, reduces broadcast traffic, and allows logical grouping.

Examples:

- VLAN 10 - for admin
- VLAN 20 - for students

NETWORK DEVICES REQUIRED:

- 1 switch
- 4 PCs
- Straight-through cables

PROCESS:

Step 1: Set up the devices.

- Add 1 2960 switch
- Add 4 PCs (PC0,PC1,PC2,PC3)
- Connect all the PCs to switch.

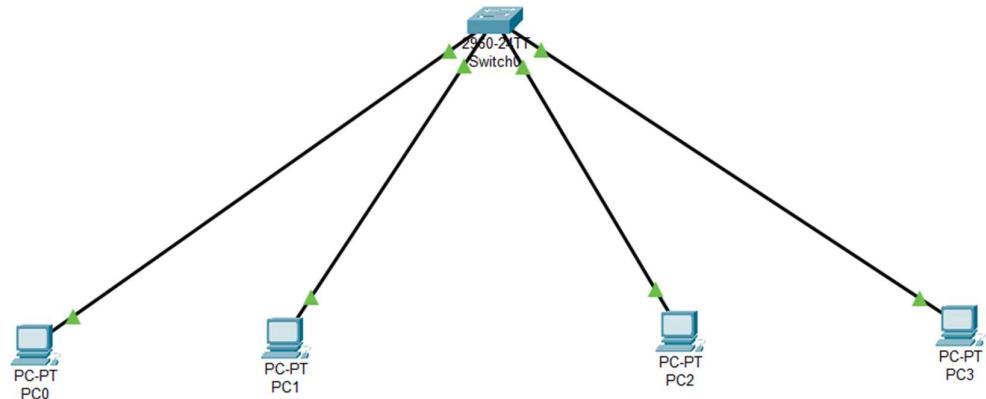

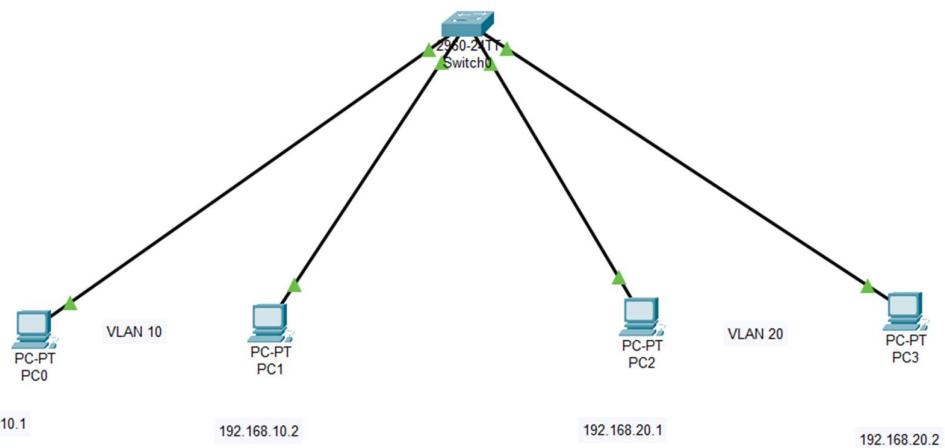

Figure 13: Connection between all the devices using wires

Step 2: Assign IP addresses

Step 3: Click the switch and go to CLI for configuration.

A screenshot of a computer screen displaying a terminal window titled "Switch0". The window has tabs for "Physical", "Config", "CLI", and "Attributes", with "CLI" being the active tab. The title bar includes standard window controls (minimize, maximize, close) and a Cisco logo. The main area of the window is titled "IOS Command Line Interface". It displays system information, including the motherboard serial number (FOC10093R12), power supply serial number (AZS1007032H), and model (WS-C2960-24TT-L). It also shows the switch ports (1-26), their model (WS-C2960-24TT-L), SW Version (15.0(2)SE4), and SW Image (C2960-LANBASEK9-M). Below this, there is a copyright notice for Cisco IOS Software, version 15.0(2)SE4, released on June 26, 2013. The window ends with a message "Press RETURN to get started!" followed by several log entries indicating link changes and protocol up/down events for various interfaces.

```

Step 7: Assign IP addresses to all the PCs. Click to pc → desktop → IP configuration.

OBSERVATION:

Ports fa0/1 and fa0/2 comes under VLAN 10 and fa0/3-7 comes under VLAN 20.

OUTPUT:

The screenshot shows the Cisco Packet Tracer PC Command Line interface. The window title is "PC0". The menu bar includes "Physical", "Config", "Desktop" (which is selected), "Programming", and "Attributes". A blue header bar says "Command Prompt". The main area displays the following output:

```
Cisco Packet Tracer PC Command Line 1.0
C:\>ping 192.168.10.1

Pinging 192.168.10.1 with 32 bytes of data:

Reply from 192.168.10.1: bytes=32 time=7ms TTL=128
Reply from 192.168.10.1: bytes=32 time<1ms TTL=128
Reply from 192.168.10.1: bytes=32 time=11ms TTL=128
Reply from 192.168.10.1: bytes=32 time=16ms TTL=128

Ping statistics for 192.168.10.1:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
    Approximate round trip times in milli-seconds:
        Minimum = 0ms, Maximum = 16ms, Average = 8ms

C:\>
```

CONCLUSION:

VLAN is implemented using Cisco Packet tracer.

LAB 6

TITLE: IMPLEMENTATION OF OSPF USING PACKET TRACER.

BACKGROUND THEORY: OSPF (Open Shortest Path First) is a dynamic routing protocol used to find the best path between routers. It is link-state, supports VLSM and updates only when changes occur. OSPF uses areas (default area is area 0) and identifies routers using Router IDs.

NETWORK DEVICES REQUIRED:

- 2 Routers
- 4 PCs
- 2 Switches
- Straight through cables
- Cross-over wire

PROCESS:

Step 1: Setup all the devices as in the figure.

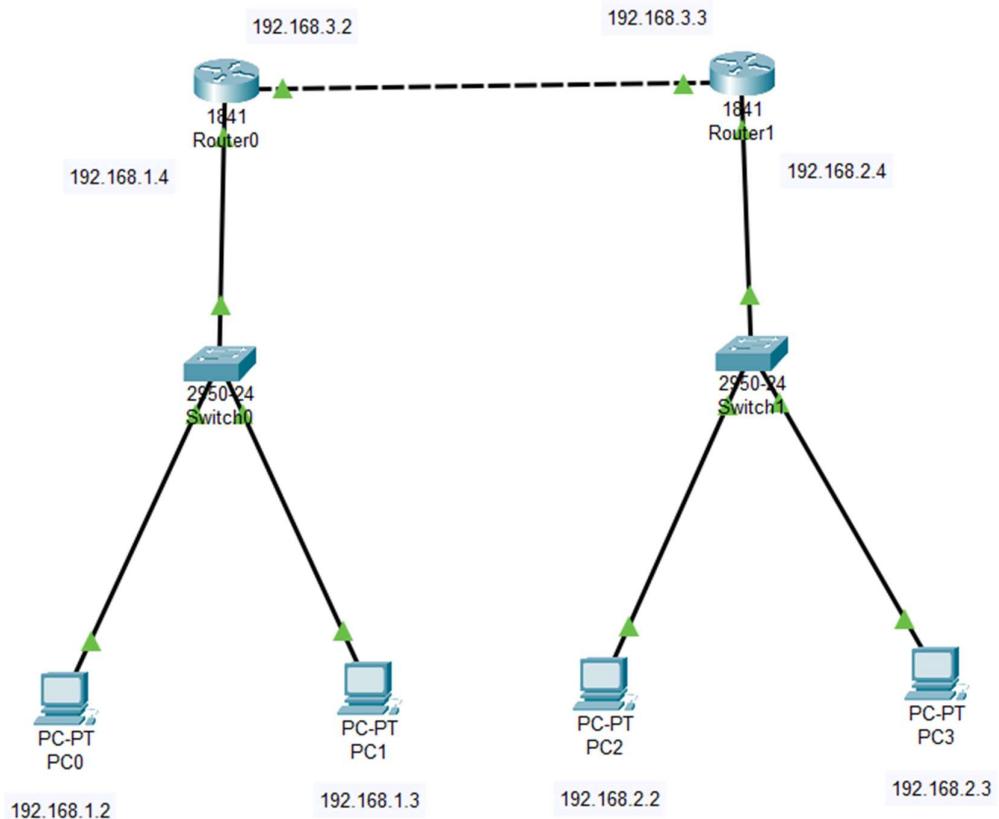

Figure 14: Network devices setup for OSPF

Step 2: Assign IP address to all the PCs like the figure below for PC0.

Click on PC→ Desktop →IP Configuration

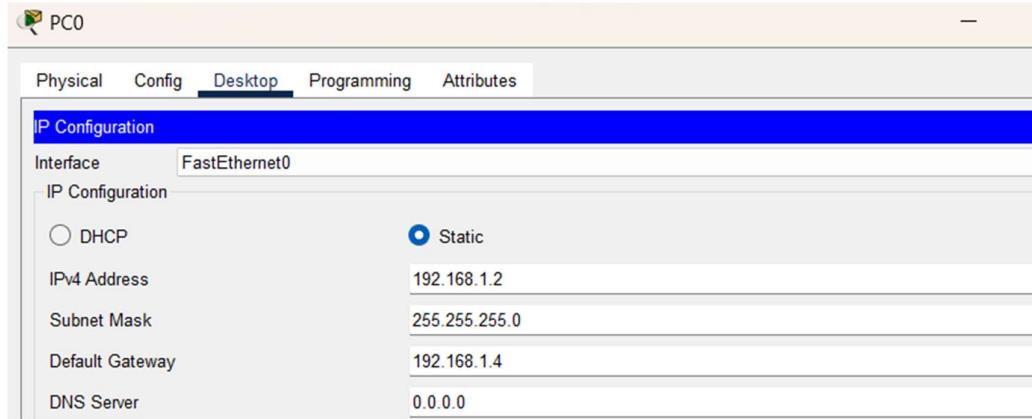

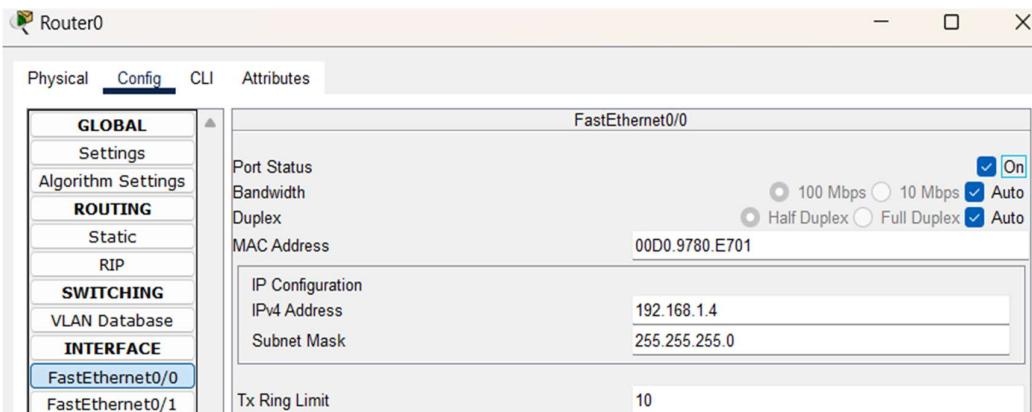

Figure 15: Assigning IP address for PC0

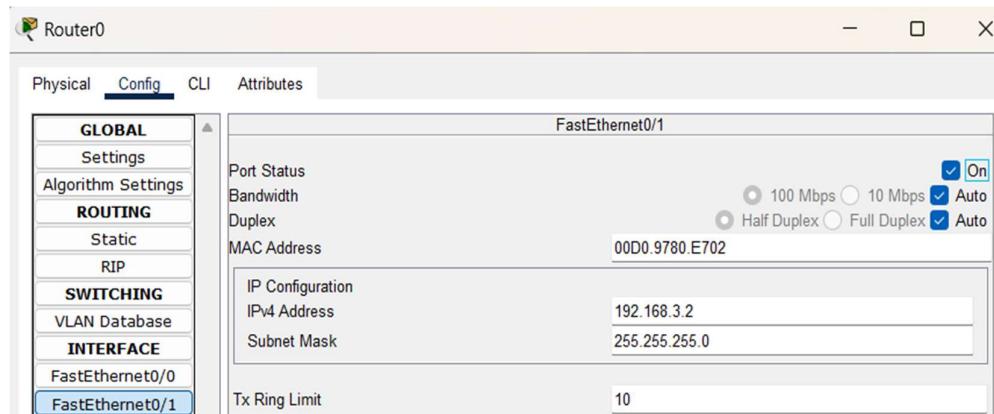

Step 2: Configure Router0

- For FastEthernet0/0,

Click on Router→ Config→FastEthernet0/0

- Again, for FastEthernet0/1

- o Configure Router1 assigning 192.168.2.4 IP address for 0/0 and 192.168.3.3 IP address for 0/1.

Step 3: Now, configure OSPF on routers.

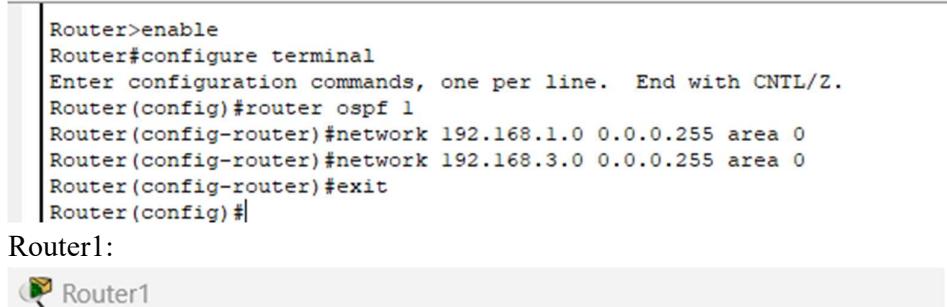

- o Router0: Click on Router→ CLI

```

Router>enable
Router#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)#router ospf 1
Router(config-router)#network 192.168.1.0 0.0.0.255 area 0
Router(config-router)#network 192.168.3.0 0.0.0.255 area 0
Router(config-router)#exit
Router(config)#

```

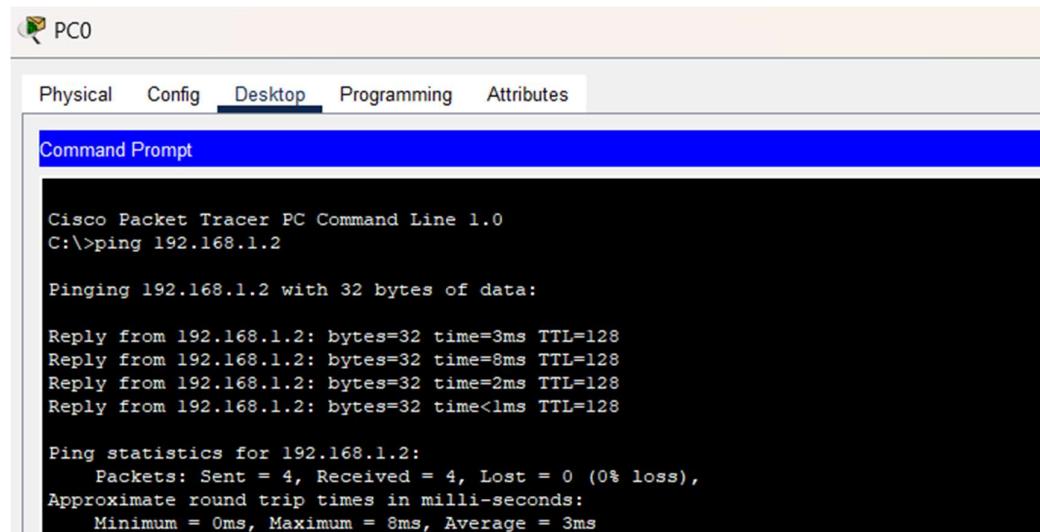

```

Router>enable
Router#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)#router ospf 2
Router(config-router)#network 192.168.2.0 0.0.0.255 area 0
Router(config-router)#network 192.168.3.0 0.0.0.255 area 0
Router(config-router)#exit
Router(config)#

```

Step 4: Test the network.

```

Cisco Packet Tracer PC Command Line 1.0
C:\>ping 192.168.1.2

Pinging 192.168.1.2 with 32 bytes of data:

Reply from 192.168.1.2: bytes=32 time=3ms TTL=128
Reply from 192.168.1.2: bytes=32 time=8ms TTL=128
Reply from 192.168.1.2: bytes=32 time=2ms TTL=128
Reply from 192.168.1.2: bytes=32 time<1ms TTL=128

Ping statistics for 192.168.1.2:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
    Approximate round trip times in milli-seconds:
        Minimum = 0ms, Maximum = 8ms, Average = 3ms

```

CONCLUSION:

OSPF is implemented successfully using Cisco Packet tracer

LAB 7

TITLE: CONFIGURE FTP SERVER USING CISCO PACKET TRACER.

BACKGROUND THEORY:

The primary purpose of an FTP server is to allow users to upload and download files. An FTP server is a computer that has a file transfer protocol (FTP) address and is dedicated to receiving an FTP connection. FTP is a protocol used to transfer files via the internet between server (sender) and a client (receiver). An FTP server is a computer that offers files available for download via an FTP protocol, and it is common solution used to facilitate remote data sharing between computers.

NETWORK DEVICES REQUIRED:

- 1 server
- 1 switch
- 2 PCs
- Straight through wires

PROCESS:

Step 1: Connect PCs and server to the switch using straight through cables.

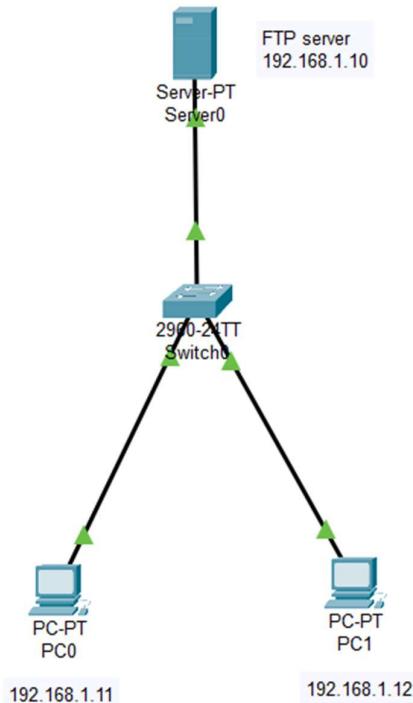

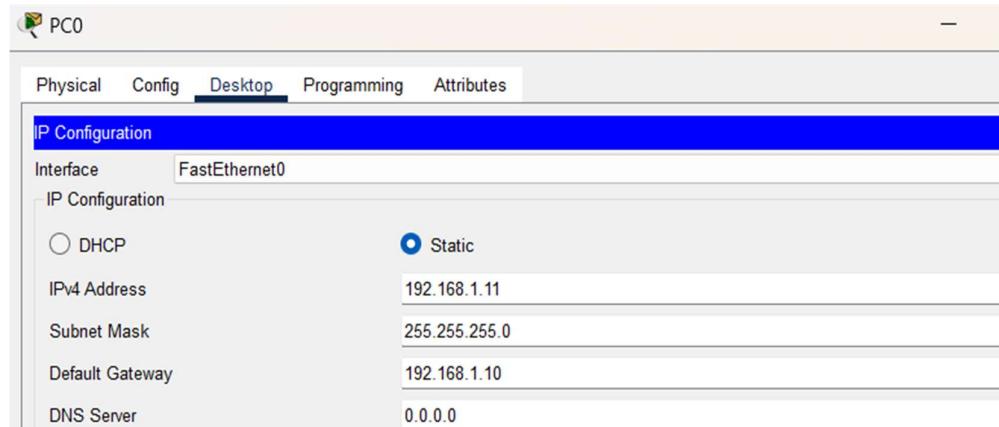

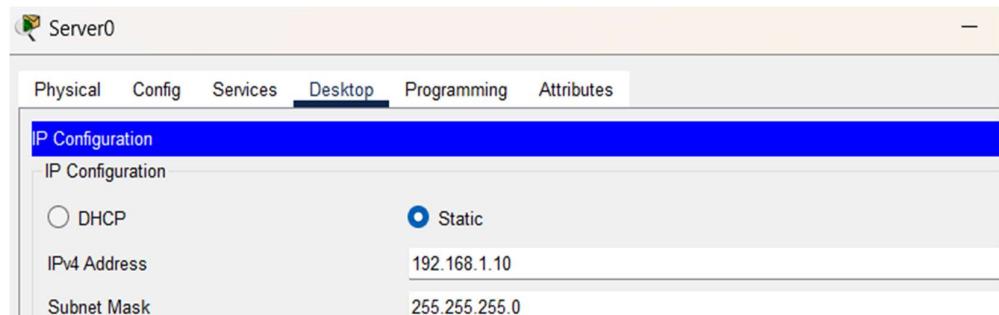

Figure 16: FTP server configuration

Step 2: Assign IP addresses to PCs and server.

- For each PC, → Desktop → IP Configuration

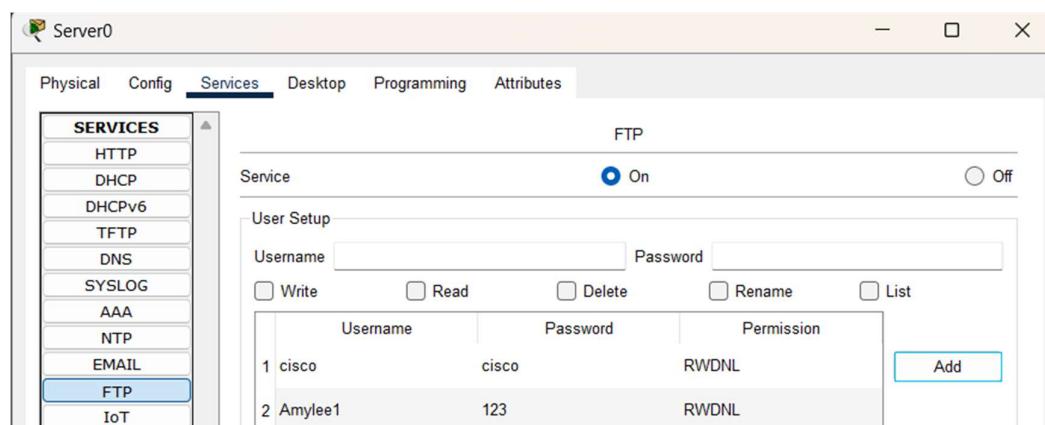

- Assign 192.168.1.12 to PC1.
- Now, for server:

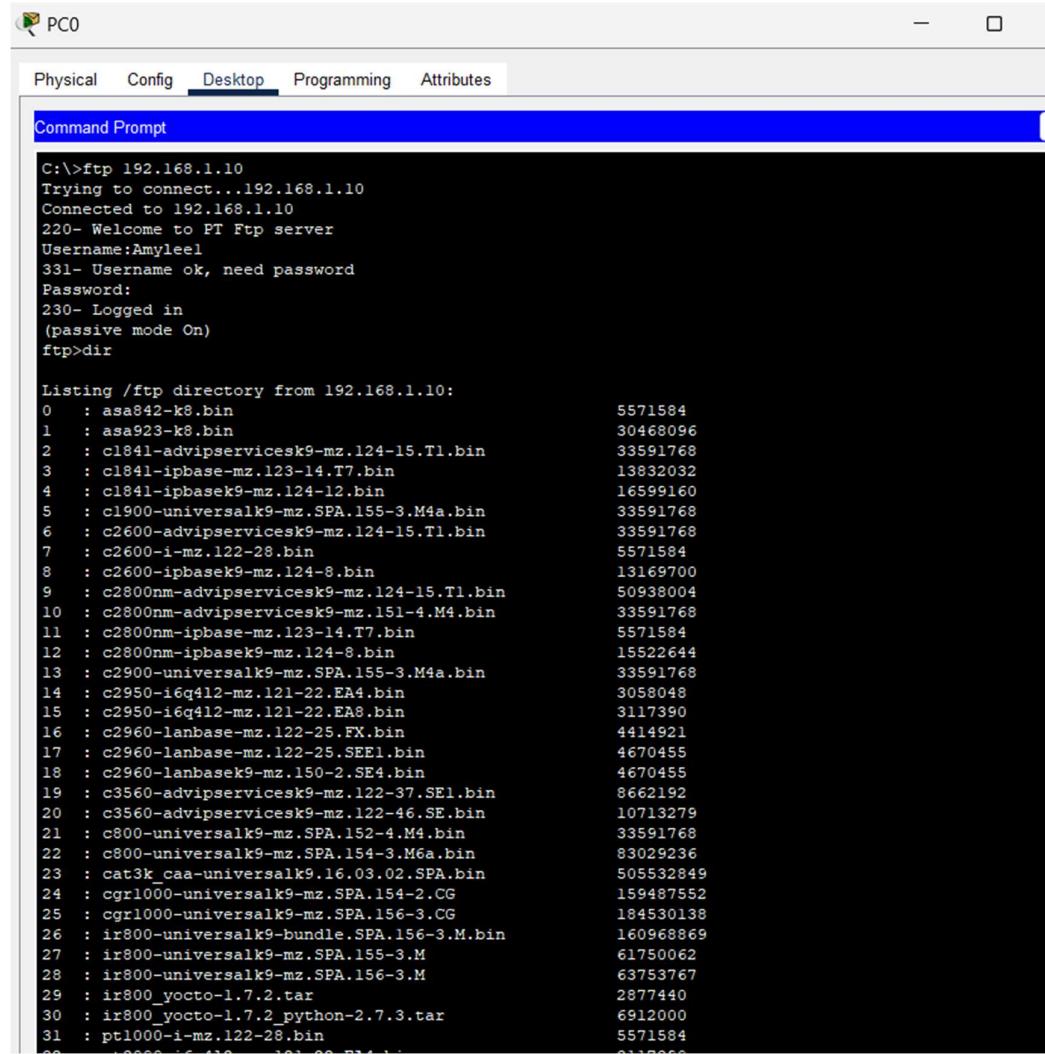

Step 3: Configure the FTP server.

Server → Services → FTP, add username and password.

Step 4: Test FTP from PC0

PC0 → Desktop → Command Prompt

The screenshot shows a Windows Command Prompt window titled "PC0". The tab bar at the top has "Physical", "Config", "Desktop" (which is selected), "Programming", and "Attributes". The main area is titled "Command Prompt" and contains the following text:

```
C:\>ftp 192.168.1.10
Trying to connect...192.168.1.10
Connected to 192.168.1.10
220- Welcome to PT Ftp server
Username:Amyleel
331- Username ok, need password
Password:
230- Logged in
(passive mode On)
ftp>dir

Listing /ftp directory from 192.168.1.10:

```

Figure 17: List of all the files

CONCLUSION:

The FTP server is successfully configured and ready to list, download or upload files.

LAB 8

TITLE: CONNECTION TWO PC'S USING RJ45 CABLE (ETHERNET CABLE)

BACKGROUND THEORY:

Connection two PC's with an RJ45 cable create a small LAN without needing any switches or routers. By manually assigning IP addresses and configuring network settings, both computers can share and communicate directly. This setup is based on Ethernet standards, IP addressing and peer-to-peer networking principles.

NETWORK DEVICES REQUIRED:

- 2PCs or laptop with Ethernet port
- 1 Ethernet cable crossover cable
- Administrator access on both PCs

PROCESS:

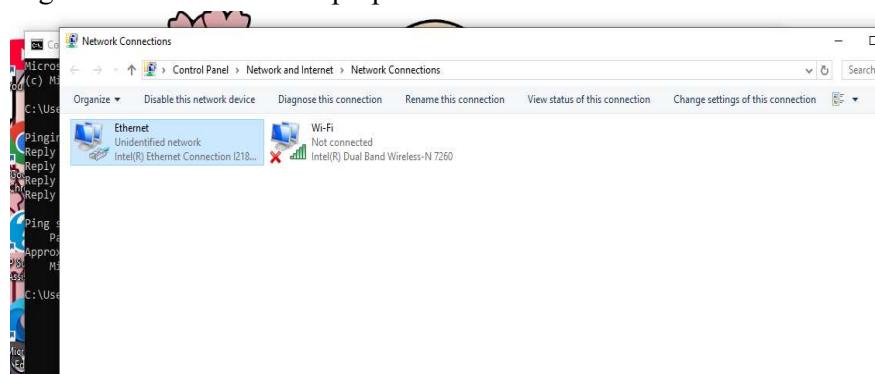

Step 1: Connect two laptops with RJ45 cable

- Ping one end of the RJ45 cable into the LAN port of laptop1.
- Ping the other end into the LAN port of laptop2.

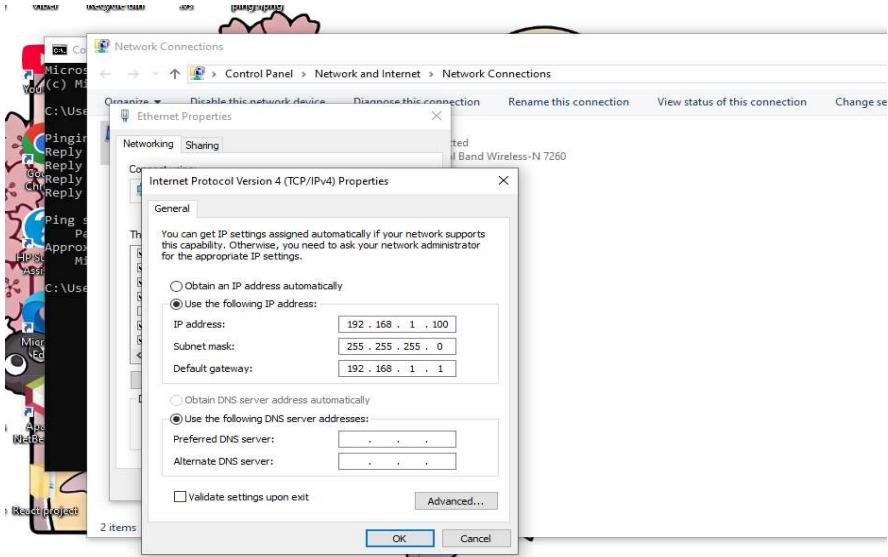

Step 2: Assign IP addresses manually.

On laptop1:

- Open control panel -> network and sharing center
- Click change adapter settings.
- Right click on Ethernet -> properties

- Click on internet protocol version 4 -> properties
- Assign IP addresses and subnet mask.
- Click to save

On laptop2:

- Repeat same steps.
- Set IP address(192.168.1.101)
- Click OK

Step 3: Test connection (ping)

- On laptop1, open command prompt
- Type ping and IP address of laptop2(192.168.1.101)

```
on Command Prompt
Microsoft Windows [Version 10.0.19045.5965]
(c) Microsoft Corporation. All rights reserved.

C:\Users\sonut>ping 192.168.1.101

Pinging 192.168.1.101 with 32 bytes of data:
Reply from 192.168.1.101: bytes=32 time<1ms TTL=128
Reply from 192.168.1.101: bytes=32 time<1ms TTL=128
Reply from 192.168.1.101: bytes=32 time<1ms TTL=128
Reply from 192.168.1.101: bytes=32 time=1ms TTL=128

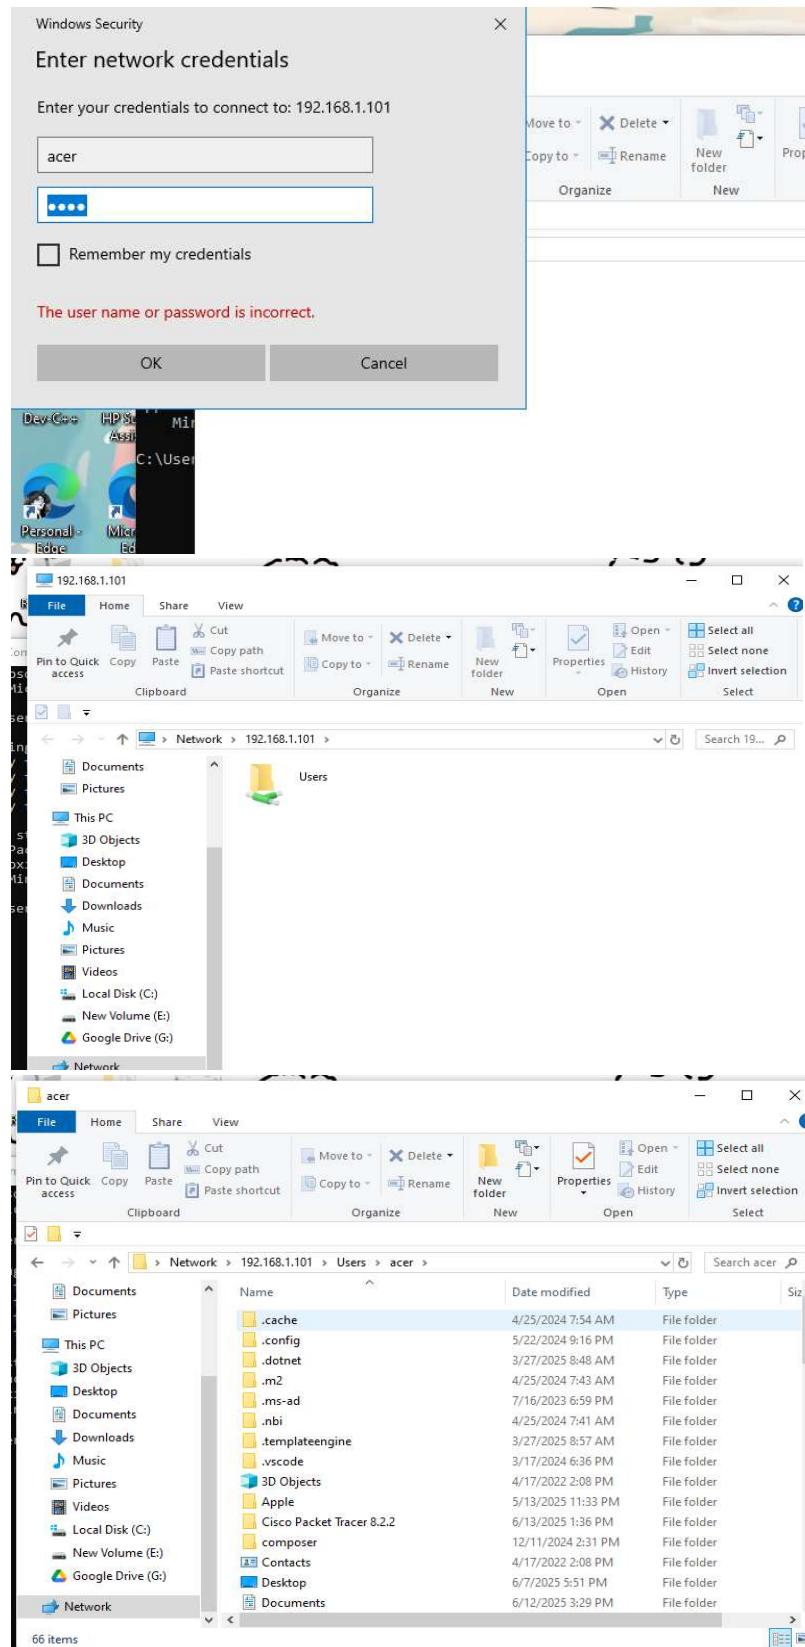

Ping statistics for 192.168.1.101:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
    Approximate round trip times in milli-seconds:
        Minimum = 0ms, Maximum = 1ms, Average = 0ms
```

OBSERVATION:

Reply from 192.168.1.101 , connection working.

Step 4: Share and access file between laptops

- Enable file sharing on both laptops.
- Open command prompt on laptop1 and type IP address of laptop2.
- Click ok.
- For connection u should enter laptop2 username and password
- Now we can access laptop2 and share files.

CONCLUSION

Connecting two laptops using a RJ45 Ethernet cable is a simple and effective method for creating a direct local network without needing a switch or router.

LAB 10

TITLE: INTRODUCTION TO WIRESHARK

BACKGROUND THEORY:

Wireshark is a free and open-source network protocol analyser. It is used to capture network packets and display the packet data in detail. This helps network administrators, security analysts, and students understand how data travels through networks.

Common protocols we can analyse are:

- Ethernet (Data Link Layer)
- IP, ICMP (Network Layer)
- TCP, UDP (Transport Layer)
- HTTP, DNS, FTP (Application Layer)

OBJECTIVE:

- To understand the basics of Wireshark.
- To learn how to capture and analyse network packets in real-time.
- To identify different types of protocols in network traffic (e.g. Ethernet, IP, TCP, HTTP).

REQUIREMENTS:

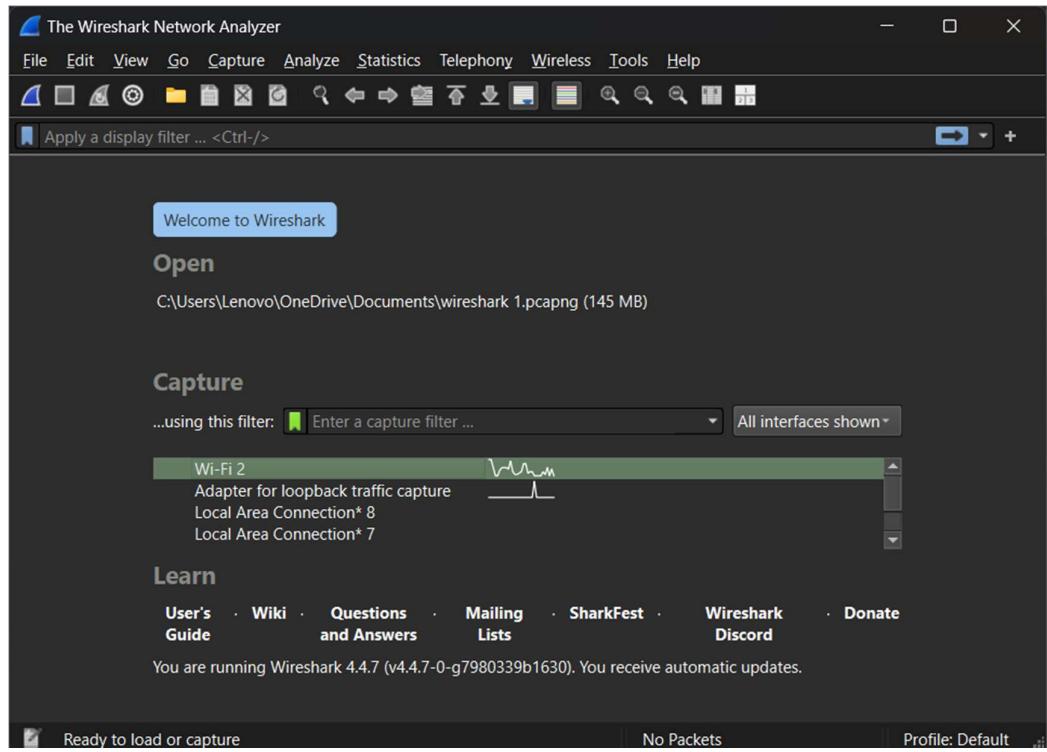

- Wireshark(latest version)
- A laptop with internet connection
- Any web browser (e.g. chrome)

PROCEDURE:

Step 1: Install Wireshark from <https://www.wireshark.org>.

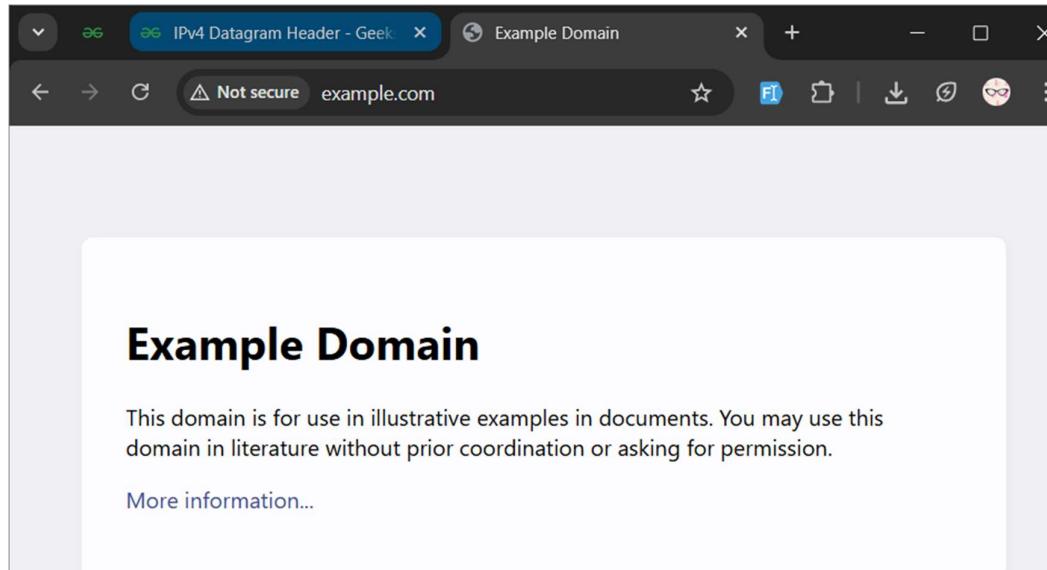

Step 2: Start capture:

- Launch Wireshark
- Select the active network interface(e.g. WI-FI)
- Click the start capture button.

Step 3: Generate Traffic

- Open a browser and visit a website (e.g. <http://example.com>).

Step 4: Apply filters

- http: to see HTTP traffic

Step 5: Stop capture (red square icon)

Step 6: Analyze packets:

- Click on any packet to see its detailed headers.

RESULT:

Successfully captured and filtered real-time packets using Wireshark.

CONCLUSION

Wireshark is a powerful tool for understanding network protocols and traffic. This lab helped gain hands-on experience in capturing and analyzing live packets and identifying how communication takes place at different layers of the OSI model.

LAB 11

TITLE: ANALYZING HTTP PROTOCOL USING WIRESHARK

BACKGROUND THEORY:

HTTP (Hypertext Transfer Protocol) is an application-layer protocol used for transmitting hypermedia documents, such as HTML. It follows a request-response model and is the foundation of data communication on the web.

Common HTTP Methods:

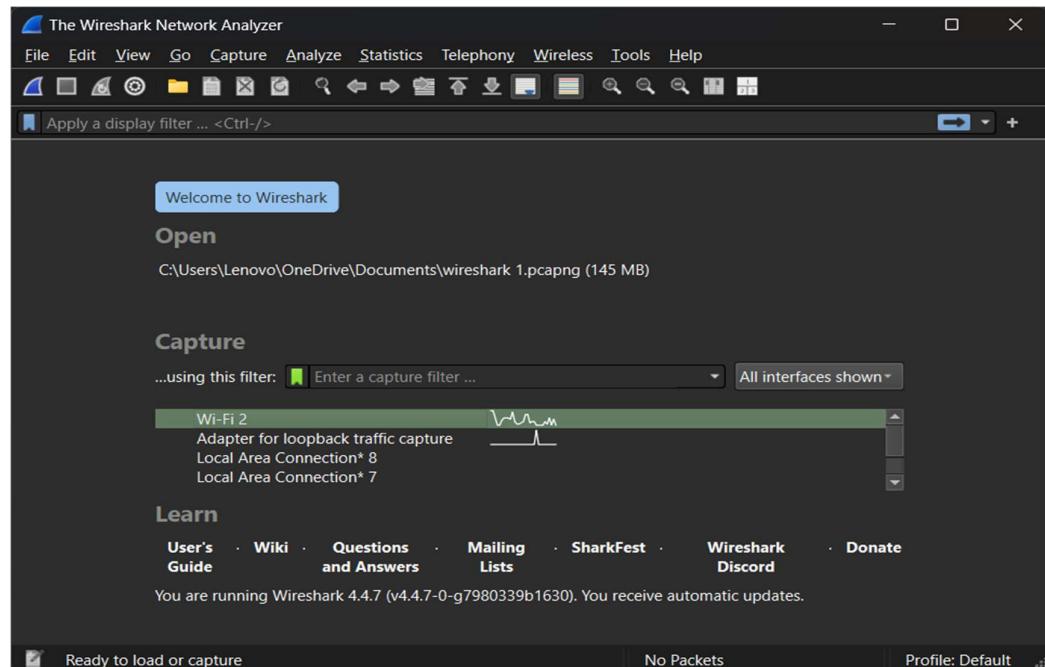

- GET – Request data from a server
- POST – Send data to a server
- Response Codes – 200 OK, 404 Not Found, 403 Forbidden, etc.

TOOLS REQUIRED:

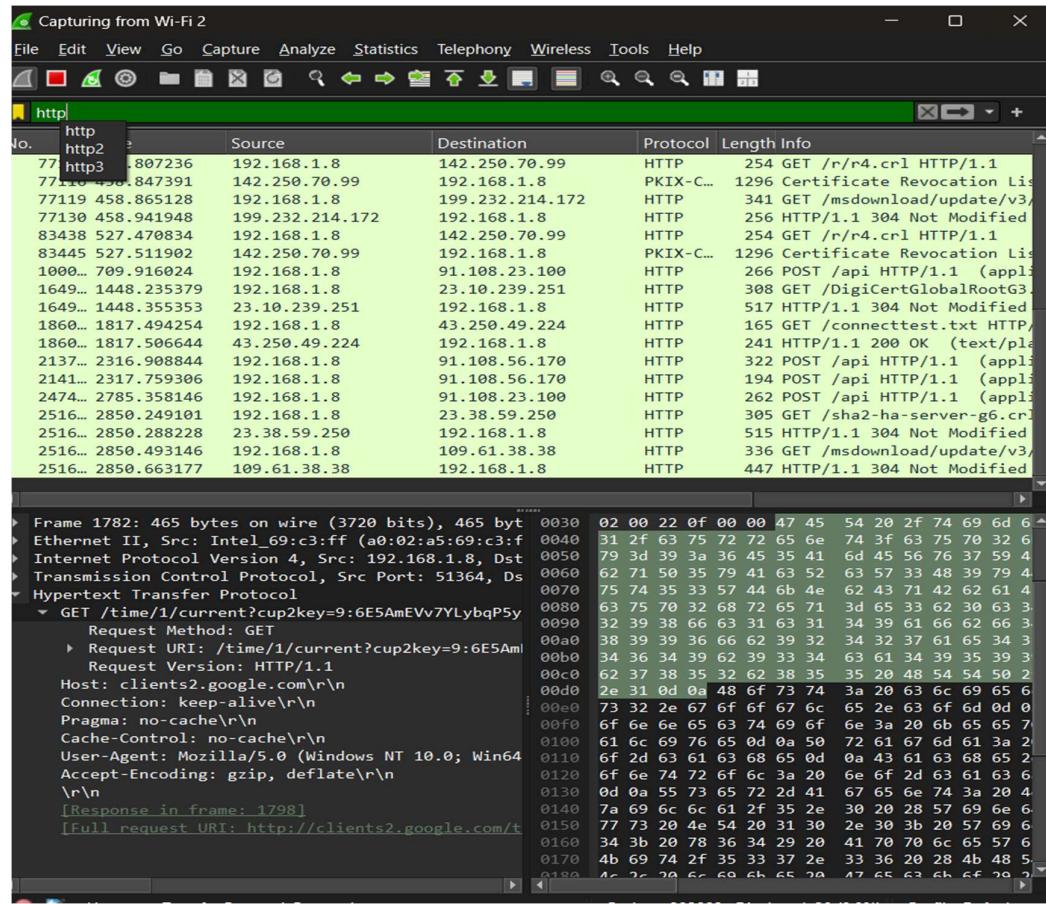

- Wireshark
- Web browser
- Internet connection

PROCEDURE

Step 1: Open Wireshark and select network interface i.e WIFI

Step 2: In the display filter bar, apply HTTP filter.

RESULT:

We have successfully captured HTTP request and response packets. The verified usage of GET method is observed.

CONCLUSION:

Wireshark is a powerful tool to monitor and analyze network traffic. This lab helped understand how HTTP operates at the application layer and how web communication takes place.

LAB 12

TITLE: USING ALL THE FILTERS IN WIRESHARK

BACKGROUND THEORY:

Wireshark is a free and open-source network protocol analyser. It is used to capture network packets and display the packet data in detail. This helps network administrators, security analysts, and students understand how data travels through networks.

Common protocols we can analyse are:

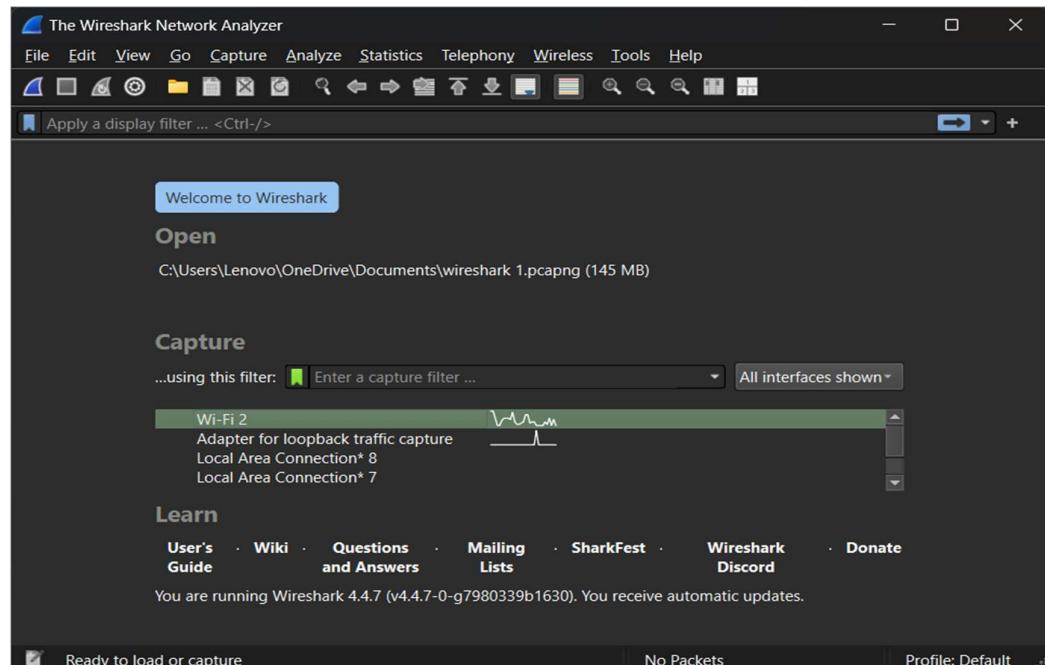

- Ethernet (Data Link Layer)
- IP, ICMP (Network Layer)
- TCP, UDP (Transport Layer)
- HTTP, DNS, FTP (Application Layer)

TOOLS REQUIRED:

- Wireshark
- Web browser
- Internet connection

PROCEDURE

Step 1: Open Wireshark and select network interface i.e WIFI

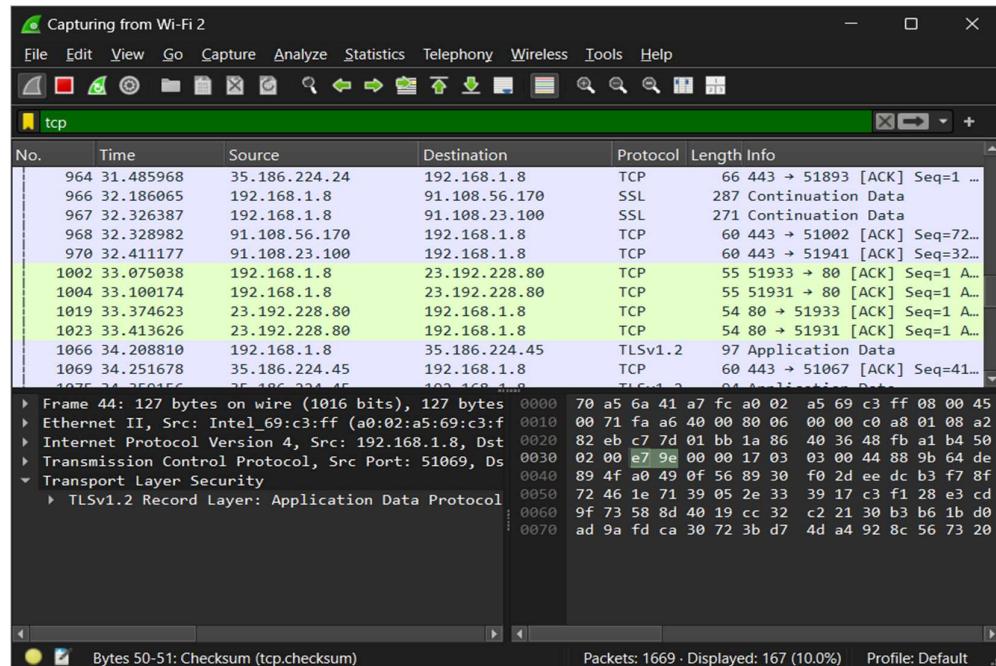

Step 2: In the display filter bar, apply filters.

Filters commonly used are:

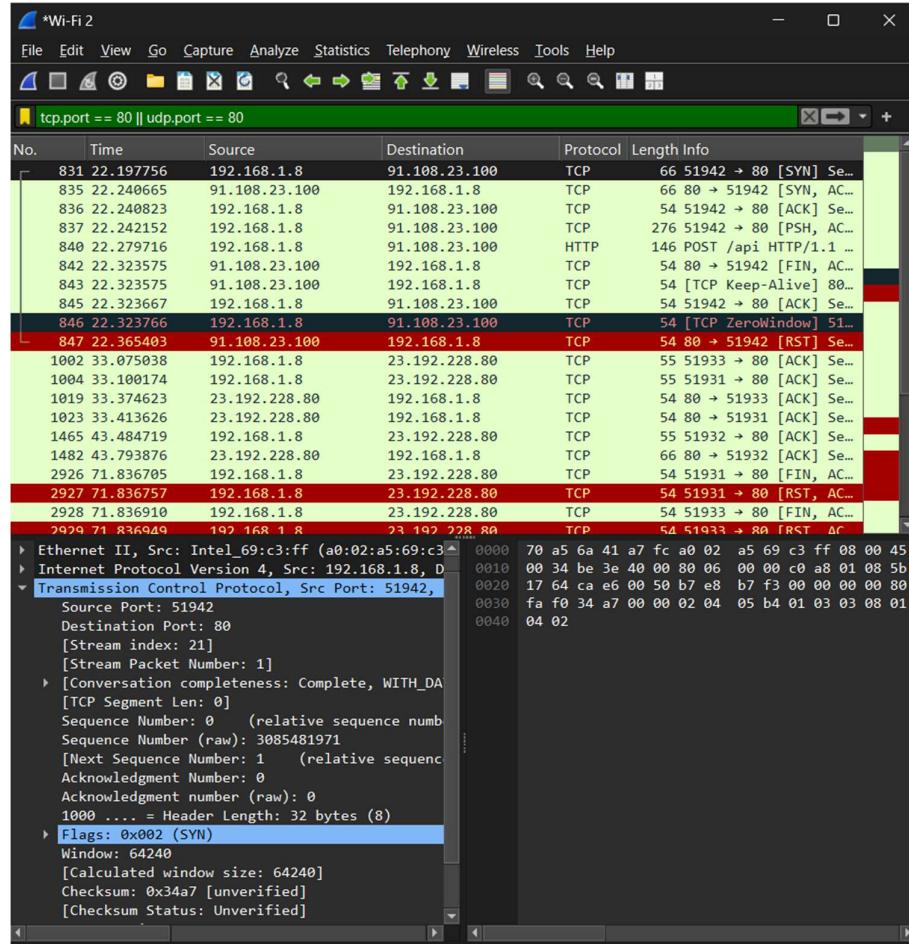

Wireshark filters commonly used	
www.thenetworkdna.com	
FILTERS	DESCRIPTION
ip.addr == 10.0.0.0/24	Show all traffic to and from any address in 10.0.0.0/24
ip.addr == 10.0.0.1	Show all traffic with 10.0.0.1 as either source or destination.
!(ip.addr == 10.0.0.1)	Exclude all traffic to or from 10.0.0.1
icmp.type == 3	Show ICMP "destination unreachable" packets.
tcp or udp	Show TCP or UDP traffic.
tcp.port == 80	Show TCP traffic with port 80.
tcp.srcport < 1000	Show TCP traffic with source port range.
http or dns	Show all HTTP or DNS traffic.
tcp.flags.syn == 1	Show TCP packets with SYN flag set.
tcp.flags == 0x012	Show TCP packets with both SYN and ACK flags set.
tcp.analysis.retransmission	Show all retransmitted TCP packets.
http.request.method == "GET"	Show TCP packets associated with HTTP GET.
http.response.code == 404	Show packets associated with HTTP 404 response.
http.host == "www.abc.com"	Show HTTP traffic matching the Host header field
tls.handshake	Show only TLS handshake packets.
tls.handshake.type == 1	Show client Hello packet during TLS handshake.
dns.resp.name == cnn.com	Show DNS responses with name field of "cnn.com"
frame contains keyword	Show all packets that contain the word "keyword"
frame.len > 1000	Show all packets with total length larger than 1000 bytes.
dhcp and ip.addr == 10.0.0.0/24	Show DHCP traffic for 10.0.0.0/24 subnet.
dhcp.hw.mac_addr == 00:11:22:33:44:55	Show DHCP packets for client MAC address.
ip.src == 10.0.0.1 && ip.dst == 10.0.0.2	Show all traffic from 10.0.0.1 to 10.0.0.2.

Please like & share the post !

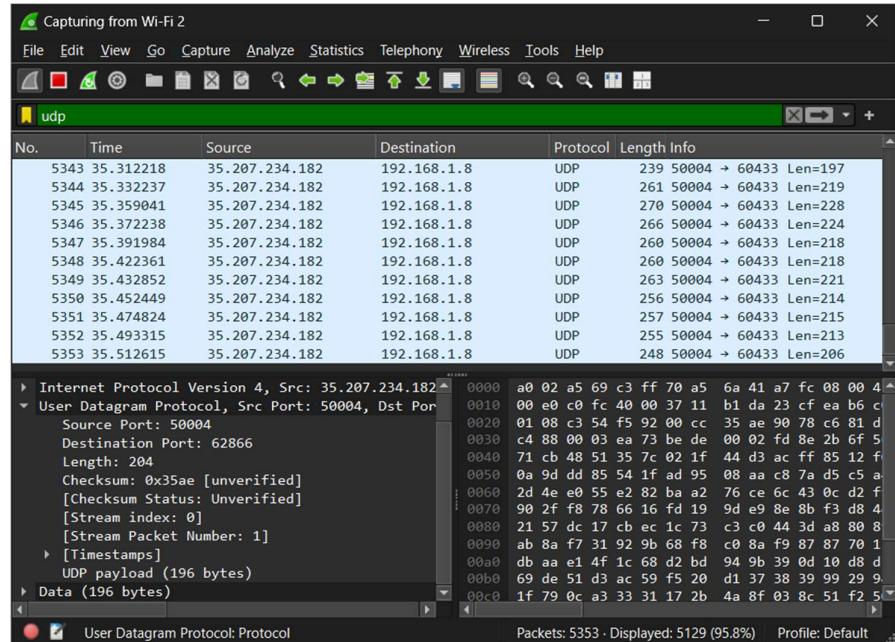

i. TCP (Shows all the TCP traffic)

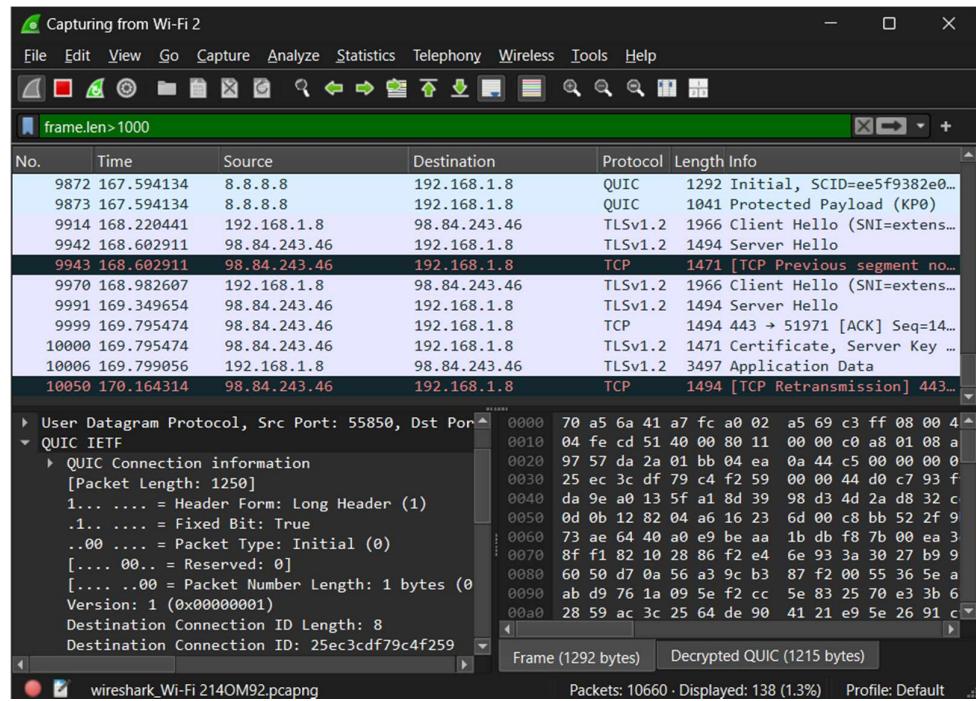

ii. tcp.port == 80 || udp.port == 80

iii. udp

iv. frame.len>1000

CONCLUSION:

Wireshark is a powerful tool to monitor and analyze network traffic.
